

# HP 3000 Computer Systems

MPE V Tables Manual for MPE V/E, Version G.01.00

**HP 3000 Computer Systems**

**MPE V TABLES MANUAL  
for MPE V/E, Version G.01.00**

19447 PRUNERIDGE AVENUE, CUPERTINO, CA 95014

### CAUTION

The normal checks and limitations that apply to the standard MPE users are bypassed in Privileged Mode. It is possible for a Privileged Mode program to destroy file integrity including the MPE operating system software itself. Upon request Hewlett-Packard will investigate and attempt to resolve problems resulting from the use of Privileged Mode code. This service is available on a time and materials billing basis. However, Hewlett-Packard will not support, correct, or attend to any modifications of the MPE operating system software.

### NOTICE

The information contained in this manual is proprietary and may not be disclosed to third parties. The terms and conditions of release of this information to the recipient are governed by the agreement executed at and between Hewlett-Packard and the recipient regarding the HP 3000 internal MPE V System Table Structures, including the MPE V Tables Manual for MPE V Operating System.

Hewlett-Packard does not warrant the accuracy or completeness of the information contained in this manual. Hewlett-Packard may make revisions to the MPE operating system or CPU firmware that may affect the information and specifications contained herein. Hewlett-Packard shall have no obligation to provide the recipient with notification of revisions, corrections, or updates regarding the information contained herein.

Hewlett-Packard shall not be responsible for any loss or damage to the recipient, its customers, or any third party caused by the recipient's use of the information provided herein.

# LIST OF EFFECTIVE PAGES

The List of Effective Pages gives the date of the current edition, and lists the dates of all changed pages. Unchanged pages are listed as "ORIGINAL". Within the manual, any page changed since the last edition is indicated by printing the date the changes were made on the bottom of the page. Changes are marked with a vertical bar in the margin. If an update is incorporated when an edition is reprinted, these bars and dates remain. No information is incorporated into a reprinting unless it appears as a prior update.

First Edition . . . . .January 1985

Effective Pages	Date
-----------------	------

ALL . . . . .	JAN 1985
---------------	----------

# PRINTING HISTORY

New editions are complete revisions of the manual. Update packages, which are issued between editions, contain additional and replacement pages to be merged into the manual by the customer. The date on the title page and back cover of the manual changes only when a new edition is published. When an edition is reprinted, all the prior updates to the edition are incorporated. No information is incorporated into a reprinting unless it appears as a prior update.

The software date code number printed alongside the date indicates the version level of the software product at the time the manual edition or update was issued. Many product updates and fixes do not require manual changes, and conversely, manual corrections may be done without accompanying product changes. Therefore, do not expect a one-to-one correspondence between product updates and manual updates.

First Edition . . . . . JAN 1985 . . . . . G.01.00

# CONTENTS

PREFACE . . . . .	xix
-------------------	-----

## CHAPTER 1 MEMORY LAYOUT

Fixed Low Memory (Series 44/48/64/68) . . . . .	1-1
System Global Area . . . . .	1-3
SysGlob Extension . . . . .	1-15
SYSDB Words . . . . .	1-18
SysGlob Word Definitions . . . . .	1-18
Allow Mask Format . . . . .	1-20
Logging Related Locations . . . . .	1-21
FLAGX . . . . .	1-21
Process Stop List General Layout . . . . .	1-22
Entry Format . . . . .	1-22
Pre-assigned Entries . . . . .	1-22
Initial Memory Allocation . . . . .	1-23
Bank 0 . . . . .	1-24
Bank 1 . . . . .	1-25

## CHAPTER 2 MEMORY MANAGEMENT TABLES

Segment Table Structure. . . . .	2-1
Pointers and DST #'s of Segment Table Components . . . . .	2-2
Standard Object Identifier Format . . . . .	2-3
DST Entry Formats . . . . .	2-3
CST Entry Formats . . . . .	2-5
ST Entry Field Descriptions. . . . .	2-6
CSTBLK Format . . . . .	2-6
Program Blocks and the CSTXMAP . . . . .	2-7
Entry Format - CST Extension Block . . . . .	2-7
Fixed DST Entry Assignments . . . . .	2-8
Swap Tables . . . . .	2-11
SWAPTAB Entry 0 Format. . . . .	2-11
SWAPTAB Unassigned Entry Format. . . . .	2-12
Segment Locality Lists (SLL) . . . . .	2-13
SLL Header Format. . . . .	2-14
SLL List Entry Format . . . . .	2-15
Special Request Table. . . . .	2-16
Main Memory Region Headers and Trailers . . . . .	2-18
Global Region Trailer. . . . .	2-19
Global Region Header (Available Regions) . . . . .	2-19
Subregion Header (Available Regions) . . . . .	2-20
Global Region Header (Reserved Regions) . . . . .	2-21
Subregion Header (Reserved Regions) . . . . .	2-22
Global Region Header (Assigned Regions) . . . . .	2-23
Subregion Header (Assigned Regions). . . . .	2-24
Subregion Header (Cached Regions) . . . . .	2-25
Region Header and Trailer Field Descriptions . . . . .	2-26
Space Allocation Structures. . . . .	2-28

# CONTENTS (Continued)

## CHAPTER 3 DISC LAYOUT

System Disc Layout . . . . .	3-1
Disc Label (Sector 0 of Disc) . . . . .	3-4
System Volume . . . . .	3-4
Serial Volume . . . . .	3-6
Slave Volume . . . . .	3-9
Defective Tracks Table (Sector 1 of Disc) . . . . .	3-11
Defective Sector Table (DSCT -- Sector 1 of Disc) . . . . .	3-12
Reserved Area Bit Map (Sector 4 of the System Disc) . . . . .	3-13
Disc Cold Load Information Table (Sectors 28-30) . . . . .	3-14
INITIAL Program CST Map . . . . .	3-19
SYSDUMP/INITIAL Communication Record . . . . .	3-20
Cold Load Information Table Extension . . . . .	3-22
Virtual Disc Space Management Structures . . . . .	3-23
Virtual Disc Space Management Table . . . . .	3-23
General Structure . . . . .	3-23
VDSMTAB Entry 0 Format . . . . .	3-24
VDSMTAB General Entry Format . . . . .	3-25
Volume Table . . . . .	3-26
Typical Private Volume Entry . . . . .	3-27
Typical System Volume Entry . . . . .	3-28

## CHAPTER 4 DIRECTORY

Introduction to the Directory . . . . .	4-1
Overview of Directory . . . . .	4-2
Directory Data Segment . . . . .	4-3
Directory Pointer Area . . . . .	4-5
Directory Space Data Segment (DIRSDS) . . . . .	4-6
Directory Structure . . . . .	4-10
Directory Definitions . . . . .	4-11
Index Block Prefix (10 Words) . . . . .	4-11
Index Entry (6 Words) . . . . .	4-12
Account Entry (%36 Words) . . . . .	4-12
Group Entry (51% Words) . . . . .	4-14
File Entry (File Pointer) (6 Words) . . . . .	4-16
User Entry (19 Words) . . . . .	4-17
User Attributes/Capabilities . . . . .	4-18
Volume Set Definition Entry . . . . .	4-19
GVSLINKAGE . . . . .	4-20
GVSINFO . . . . .	4-20
GVSVOLFLAGS . . . . .	4-20
GVSVOLINFO . . . . .	4-20
Volume Set Class Entry . . . . .	4-21
GVCLINKAGE . . . . .	4-22
GVCINFO . . . . .	4-22
Volume Mask Format . . . . .	4-22

# CONTENTS (Continued)

## CHAPTER 5 LOCK RESOURCES

SIR# Allocation DST %53 . . . . .	5-1
Sir's Ordered by Sir Number . . . . .	5-1
Sir's Ordered by Ranking . . . . .	5-2
SIR Table Information. . . . .	5-3
SIR Entry Formats. . . . .	5-4
RIN Table General Layout (Initialized State) . . . . .	5-5
Allocation and Locking of Local RINS . . . . .	5-6
Allocation and Locking of File RINS . . . . .	5-7
Allocation and Locking of Global RINS . . . . .	5-8

## CHAPTER 6 FILE SYSTEM

File System Overview . . . . .	6-1
Buffers. . . . .	6-2
Table Formats . . . . .	6-3
File System Section of PCBX (PXFILE) . . . . .	6-3
Overhead. . . . .	6-4
PXFILE Control Block Table (PXFCBT). . . . .	6-6
Available Block . . . . .	6-6
Active File Table (AFT) . . . . .	6-7
File Control Block Table (CBTAB) . . . . .	6-12
Overhead . . . . .	6-13
Vector Table . . . . .	6-15
Control Block Area . . . . .	6-17
Access Control Block (ACB) . . . . .	6-18
Logical Access Control Block (LACB) . . . . .	6-19
Physical Access Control Block (PACB) . . . . .	6-21
File Control Block (FCB) . . . . .	6-37
File Label (FLAB) . . . . .	6-43
File Multi-Access Vector Table (FMAVT) . . . . .	6-52
Zero Entry Format . . . . .	6-52
Typical Entry Format. . . . .	6-53
System Global Area (SYSGLOB) . . . . .	6-54
SIRs, Locks, and Deadlocks . . . . .	6-54
Shared CBT DST. . . . .	6-55

## CHAPTER 7 PROCESS TABLES

Process Control Block Table Structure and Format . . . . .	7-1
Fixed Cells Related to PCB . . . . .	7-1
PCB Entry 0 Format . . . . .	7-2
Unassigned PCB Entry Format . . . . .	7-3
Assigned PCB Entry Format . . . . .	7-4
Process Control Block Extension (PCBX) Structure and Format. . . . .	7-8
PCBX General Structure . . . . .	7-8
PXGLOB Format . . . . .	7-9
PXFIXED Assignments . . . . .	7-10
PXFIXED Expansion Bitmap . . . . .	7-14
File System Section of PCBX (PXFILE). . . . .	7-14

# CONTENTS (Continued)

Overhead . . . . .	7-15
PXFILE Control Block Table (PXFCBT) . . . . .	7-17
Available Block . . . . .	7-17
PCBX for Core Resident System Process Stacks . . . . .	7-18
Process To Process Communication Table . . . . .	7-19
Subsystem Reserved DL Area . . . . .	7-20
FORTRAN Logical Unit Table (FLUT) . . . . .	7-21

## CHAPTER 8 JOB TABLES

Job Tables Overview . . . . .	8-1
Job Master Table Structure (JMAT) . . . . .	8-2
Job Master Table Entry (JMAT) . . . . .	8-4
Job States . . . . .	8-6
Process Job Cross Reference Table (PIXREF) . . . . .	8-7
Job Process Count Table (JPCNT) . . . . .	8-8
Job Cutoff Table (JCUT) . . . . .	8-9
Job Information Table (JIT) . . . . .	8-10
Allow Mask Format . . . . .	8-13
Job Directory Table (JDT) . . . . .	8-15
Job Data Segment Directory Entry (In JDT) . . . . .	8-16
Job Temporary File Entry (In JDT) . . . . .	8-16
File Equation Table Entry (In JDT) . . . . .	8-17
Job Line Equation Entry . . . . .	8-18
Job Control Word Table (JJCW) . . . . .	8-19
Aoptions and Foptions Word Breakdown . . . . .	8-20
PMASK Word Breakdown . . . . .	8-21
UCOP Request Queue (DST#9) . . . . .	8-22
UCOP Entry Format . . . . .	8-23

## CHAPTER 9 RELOCATABLE OBJECT CODE

USL Files Introduction . . . . .	9-1
Record 0 and Overall USL File Format . . . . .	9-1
Data Descriptors, Passed Parameters . . . . .	9-5
Pascal . . . . .	9-5
Entry Type 0 . . . . .	9-6
Entry Type 1 . . . . .	9-6
Entry Type 2 . . . . .	9-8
Entry Type 3 . . . . .	9-11
Entry Type 4 . . . . .	9-11
Entry Type 5 . . . . .	9-14
Entry Type 6 . . . . .	9-15
Entry Type 7 . . . . .	9-17
Entry Type 8 . . . . .	9-19
Entry Header Format . . . . .	9-21
Header Type 0 . . . . .	9-22
Header Type 1 . . . . .	9-22
Header Type 2 . . . . .	9-23
Header Type 3 . . . . .	9-23
Header Type 4 . . . . .	9-24
Header Type 5 . . . . .	9-24

# CONTENTS (Continued)

Header Type 6 . . . . .	9-25
Header Type 7 . . . . .	9-25
Header Type 8 . . . . .	9-26
Header Type 9 . . . . .	9-27
Header Type 10 . . . . .	9-29
Header Type 11 . . . . .	9-29
RL File Format . . . . .	9-30
Storage Management . . . . .	9-31
Entry Point Directory . . . . .	9-32
Typical Directory Entry . . . . .	9-33
Procedure Information Block . . . . .	9-34
Headers . . . . .	9-35

## CHAPTER 10 PREPARED OBJECT CODE

Program File Format . . . . .	10-1
Flags . . . . .	10-3
Flags2 . . . . .	10-4
CST Remapping Array . . . . .	10-4
Segment Descriptor Array . . . . .	10-4
Global Area Format . . . . .	10-4
External List . . . . .	10-5
Entry Point List . . . . .	10-6
Code Segment With Patch Area . . . . .	10-7
Patch Area . . . . .	10-7
PMAP Information . . . . .	10-8
PMAP Type Table . . . . .	10-8
PMAP Records . . . . .	10-9
Type 0 Segment PMAP Record . . . . .	10-9
Type 1 Procedure PMAP Record . . . . .	10-9
Type 2 Secondary Entry PMAP Record . . . . .	10-10
SL File Format . . . . .	10-11
Storage Management . . . . .	10-13
Entry Point Directory . . . . .	10-13
Typical Directory Entry . . . . .	10-14
Code Segment Linkage Structure . . . . .	10-15
Reference Table Structure . . . . .	10-17
Reference Table (256 Maximum Entries) . . . . .	10-18
Code Segment With Patch Area . . . . .	10-19
Patch Area . . . . .	10-19
PMAP Information . . . . .	10-20
PMAP Type Table . . . . .	10-20
PMAP Records . . . . .	10-21
Type 0 Segment PMAP Record . . . . .	10-21
Type 1 Procedure PMAP Record . . . . .	10-21
Type 2 Secondary Entry PMAP Record . . . . .	10-22

## CHAPTER 11 LOADER

MPE Loader . . . . .	11-1
Loader Segment Table (LST) Overview . . . . .	11-1

# CONTENTS (Continued)

LST Overview . . . . .	11-1
XLST Overview . . . . .	11-2
Loader Segment Table Primary DB . . . . .	11-3
Directory Entries . . . . .	11-4
Loader Cache . . . . .	11-10
Cache Data Segment Format . . . . .	11-10
Bucket Format . . . . .	11-10
Loader Communication Table (LCT) . . . . .	11-11
Form Incoming to Loader (Load/Allocate Program) . . . . .	11-11
Form Incoming to Loader (Load/Allocate Procedure) . . . . .	11-12
Form Returned (No Error) . . . . .	11-13
Form Returned (Error Occurred) . . . . .	11-13
Logical Segment Transform Table (LSTT) . . . . .	11-14

## CHAPTER 12 PRIVATE VOLUMES / SERIAL DISC

Mounted Volume Table (MVTAB) . . . . .	12-1
Private Volume User Table (PVUSER) . . . . .	12-4
Bind Names Data Segment . . . . .	12-6
Serial Disc Tables and Data Structures . . . . .	12-8
Data Record Format . . . . .	12-8
End of File Format . . . . .	12-9
Contiguous Block Format . . . . .	12-10
Hole Format . . . . .	12-10
Gap Table Format . . . . .	12-11
SDISC Extra Data Segments . . . . .	12-13
Serial Disc Organization . . . . .	12-15

## CHAPTER 13 I/O

I/O Table Linkage . . . . .	13-1
Device Reference Table (DRT) . . . . .	13-2
Driver Linkage Table (DLT) . . . . .	13-3
Logical-To-Physical Device Table (LPDT) . . . . .	13-4
Entry 0 . . . . .	13-5
Typical Entry (Virtual Devices) . . . . .	13-5
Typical Entry (All Real Devices) . . . . .	13-6
Entry for Terminal-Like Devices . . . . .	13-7
Entry for Tape Drives . . . . .	13-7
Entry for Disc Drives . . . . .	13-8
Logical Device Table (LDT) . . . . .	13-9
Overview of Data Segment . . . . .	13-9
Zero Entry Format . . . . .	13-9
Typical Entry Format . . . . .	13-10
Logical Device Table Extension (LDTX) . . . . .	13-11
Overview of Data Segment . . . . .	13-11
Zero Entry . . . . .	13-12
Typical Entry . . . . .	13-12
Terminal Entry . . . . .	13-13
Serial or Foreign Disc Entry . . . . .	13-14
CIPER Entry . . . . .	13-14
System or Private Volume Disc Entry . . . . .	13-14

# CONTENTS (Continued)

Device Class Table (DCT) . . . . .	13-15
Overview of Data Segment . . . . .	13-15
Header Entry Format . . . . .	13-15
Device Class Table Typical Entry Format . . . . .	13-16
Discussion . . . . .	13-16
Terminal Descriptor Table Typical Entry Format . . . . .	13-18
Interrupt Linkage Table (ILT) for HP-IB Systems . . . . .	13-19

# PREFACE

The second edition of the MPE V/E Tables Manual describes the internal table organization of the MPE V operating system. It is intended for the technically sophisticated user with Privilege Mode capability. We strongly discourage modifying the table structure because you may destroy the operating system. The following caution applies:

## CAUTION

The normal checks and limitations that apply to the standard MPE users are bypassed in Privileged Mode. It is possible for a Privileged Mode program to destroy file integrity including the MPE operating system software itself. Upon request Hewlett-Packard will investigate and attempt to resolve problems resulting from the use of Privileged Mode code. This service is available on a time and materials billing basis. However, Hewlett-Packard will not support, correct, or attend to any modifications of the MPE operating system software.

The major highlights of this edition include:

- A new chapter (24), "Native Language Support". It includes all of the character sets to support the installed languages.
- Expanded Chapter 15. It now includes Native Language Support Application Message Facility.
- A new table, DEFDATA Table. It describes the default configuration for HP-IB devices. This table is located in Chapter 16.
- A new table, Process Job Cross Reference Table. It determines the job/session main process (Command Interpreter) for any process on the system. This table is located in Chapter 8.
- Additional fields support cartridge tape, job scheduling and all other features of release G.01.00. Many chapters reflect these changes.

We hope you will find this edition informative. Your comments and suggestions are welcome via the "Reader Comment Sheet" at the back of this manual.

## SYSDB Words

System tables may be accessed by using the LST/SST instructions. Pointers have the following format:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Address												Bank			

Address is the whole word with "Bank" masked out to 00000.

Systems that have MPE V/E microcode (all 6X systems, 4X systems with new boards) can have a non-zero bank number. Systems running pre-MPE V/E microcode can only use bank 0, therefore the pointer will look like:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Address															

## SysGlob Word Definitions

ADDRESS	NAME	FUNCTION
08+55	BUSY	- SYSDB relative pointer to BUSY TABLE for I/O resources
08+56	HERO	- SYSDB relative pointer to table containing head pointers to I/O resource queues
08+57	TRAIL	- SYSDB relative pointer to table containing head pointers to tail of I/O resource queues
08+60	SIO COUNT	- Number of I/O Programs currently executing
08+72	POWER FAIL	- 0-no power fail 1-system disc recovery 2-all other disc recovery 3-all other device recovery
08+73	SYSUP	- System is up and operable
08+74	CONSLDEVN	- System console logical device number
08+400	CPU NUMBER	- Set when system aborts

G.01.00  
1- 18

JOBSYNM job synchronization via jobsynch (sysglob+121(8))

(13:1) - JOBSREROY - set by OEVRAC & MORGUE (via procedure STRATODEVICE) indicating a ready job. This prevents UCOP from going to a wait state when a job is just made ready.

(15:1) - DEVFREEO - set by OEALLOCATE when device count goes to 0.

NOTE - Both bits above used for synchronization of job-made-ready or devicefreed when UCOP is running.

(14:1) - JOBSWRITING- set by UCOP just before waiting if any job is waiting for list device. Signals OEALLOCATE to awake UCOP when a device is freed.

G.01.00  
1- 15

## Rllow Mask Format

The Rllow mask for MPE V is expanded to six words. There is a mask in each user's JIT and in the SYSGLB area. The Rllow mask contains enough bits for a one-to-one correspondence to every present OPERATOR type command, or any future OPERATOR command. When a user is Rllowed any OPERATOR command or ASSOCIATED to a device (which will use OPERATOR type commands) then the corresponding bit(s) in the mask in that user's JIT for that command is set. If the Rllow or RSSOCIATE was done on a global scale, then the bit(s) in the mask of the SYSGLB area is/are updated.

The following EQUATEs define the mask bit for each operator command.

The first set of commands define the operator commands dealing with devices.

When adding a new command to this set of EQUATEs, be sure to add a corresponding nove statement in LOGINAGE, even if the command will not be logged.

	Word	Bit	#
ABORTIO	0	0	0

## Initial Memory Allocation

This section is a description of the method used by INITIAL to allocate memory for MPE tables and code segments in MPE V/E. All memory allocated by INITIAL is permanently allocated. All non-core resident code and data is put on disc before exiting INITIAL.

At the most basic level INITIAL will try to build memory to look exactly as diagrammed below. There are, however, several ways in which to deviate from this structure. Before going into the sources of these deviations, it is necessary to point out which portions of memory are used by INITIAL during the restart and therefore cannot be used by MPE until INITIAL has finished.

Before INITIAL begins to allocate any memory space, it relocates its core resident code, its code segment swapping area and its stack to the highest configured memory space. Additionally, it uses the last 2326 words of bank 0 on series 4x machines for its I/O buffer area and temporary code segment table. After INITIAL has built all of core resident MPE (tables and code), it builds the disc resident MPE tables. Since some of the disc resident tables may be too large to be built in INITIAL's stack, these tables are built in unused memory space. Therefore, in addition to the memory space required for INITIAL's code, INITIAL's stack and core resident MPE, there must be enough space left in which to build the largest of the disc resident tables.

For Series 6x machines with the MPE V/E firmware, INITIAL will build the tables with ">" signs by then out of Bank 0 if necessary. For all other tables, INITIAL will essentially build memory in the order shown below. There may be an unused fragment of memory between the DRT's and the system global area which INITIAL will fill with the smaller tables. Neither the tables marked with an asterisk nor the code segments will ever be put in this area. NOTE: INITIAL will build all tables on 32-word boundaries.

If the system being built by INITIAL is configured with 128K words or 160K words of memory then INITIAL's stack will be in bank 1 (the code also on a 128K word memory size). If INITIAL is occupying part of bank 1 and the space is needed for a core resident MPE code segment or to build a disc resident table then INITIAL will print the error message "ERROR #350 OUT OF MEMORY".

Except for the exceptions stated above, for every allocation of memory INITIAL will first try to allocate any remaining space between the DRT's and SYSDB. It will then try the next available space in bank 0, then the next available space in bank 1. If it were necessary it could continue searching until all all banks were checked for available space.

Immediately before exiting INITIAL, INITIAL lays down all the memory region headers and trailers as shown below. For any one bank of memory there will only be one block of core resident MPE, regardless of its contents. The only block of core resident MPE that does not have a reserved region global header is in bank 0. It does have the reserved region global trailer though. Before placing any code outside bank 0 the first 24 words of every bank (except bank 0) is reserved for the region global header.

## CHAPTER 2. MEMORY MANAGEMENT TABLES

## Segment Table Structure

The current location and state of each data segment and loaded code segment is maintained in the Segment Table. This table is partitioned into three separate tables as shown in Figure 2-1. The partitions are based on the segment classes: a segment is a data segment, a segment is a system SL segment, or a segment is part of a program. The structure and format of each partition is described in the following.

Overall ST Structure

G.01.00  
2- 1

## Pointers and DST #'s of Segment Table Components

## i. DST

X 2 absolute address of entry 0 of the DST.  
X1002 sysbase relative index of entry 0 of DST.  
DST number 2 is the DST Table dst #.

## ii. CST

X 0 absolute address of entry 0 of System SL.  
X1001 sysbase relative index of entry 0 of System SL.  
X1032 displacement from DST base of entry 0 of System SL (i.e. @CST(last) - @DST(0) = DFS ).  
DST number 4 is the CSTX Table DST #.

## iii. CSTX

X 1 absolute address of entry 0 of current program.  
X1033 displacement from DST base to first CSTX entry SL.  
DST number 4 is the CSTX Table DST #.

## iv. CSTXMAP

X1051 sysbase relative index of entry 0 of CSTXMAP.  
DST number 43 (X72) is CSTXMAP Table DST #.

G.01.00  
2- 5ST Entry Field Descriptions

A = 1 ==> segment absent  
 M = 1 ==> segment privileged  
 R = 1 ==> segment has been referenced  
 T = 1 ==> segment is being traced  
 DCV = 1 ==> disc copy is valid  
 STK = 1 ==> segment is a stack  
 MOD = 1 ==> a segment modification (exp., contr.) is pending  
 FMWP = 1 ==> a forced write of this segment is in progress  
 VMPCNT = # of virtual memory pages allocated to this segment  
 RDC = 1 ==> segment is a recoverable overlay candidate  
 IMI = 1 ==> segment is in motion in  
 SYS = 1 ==> segment is a system segment  
 CORE = 1 ==> segment is core resident  
 WD = 1 ==> write disabled

CSTBLK Format

CSTBLK(0)	
0	NUMBER OF ENTRIES IN TABLE *
1	ANY UNASSIGNED ENTRY = -1 *
2	ANY ASSIGNED ENTRY > D *
3	REMAINING CSTBLK TABLE ENTRIES *

The table is initialized to minus one in each entry. When selected, the entry is replaced by a DST-relative index to the entry NO of the CST extension block. This is the the overhead entry for the associated program.

G.01.00  
2- 6Program Blocks and the CSTMRP

Since programs can be dynamically loaded and unloaded, the segment table must be kept packed or fragmentation would occur. Thus, the block of ST entries for a program segment begins at an ST entry number that changes if a program which was loaded before it gets unloaded. To manage this dynamic structure, an auxiliary structure, the CSTMRP is used. A program is identified by its index, CSTXEIX, into this map. The program's current beginning physical ST entry number is equal to equal to CSTMRP (CSTXEIX).

Entry Format - CST Extension Block

CSTMRP(CSTXEIX)	
0	* M = # OF CST'S IN BLOCK *
1	* VALIDITY=X125252 *
2	* # OF USERS SHARING BLOCK *
3	* D *
KCST	
1	* KRS CST ENTRY FORMAT * <--- X301
2	* KRS CST ENTRY FORMAT * <--- X302
	*
+M	* KRS CST ENTRY FORMAT * <--- X303

The value of CSTXEIX is established when a CST extension block is allocated. This index into the array CSTMRP is maintained in the PCB of each process sharing the block.

## Swap Tables

The SWAPTAB is a core resident memory management table used to keep track of the locality lists of the competing processes. The PCB entry for a process has a SWAPTAB relative pointer to the header entry for the process.

SWAPTAB DST# = 23 (Z27)

Z1004 System table pointer to SWAPTAB entry 0.

NOTE: The number of entries configured will be 3 greater than the number configured via SYSDUMP. (Entry 0 consumes 3 entries).

## SWAPTAB Entry 0 Format

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

## SWAPTAB Unassigned Entry Format

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---
	Z1000000															
1	TABLE RELATIVE INDEX OF NEXT FREE ENTRY															
2	TABLE RELATIVE INDEX OF PREV. FREE ENTRY															
3	0															
4	0															
5	0															

An assigned entry in the swaptab is a process' SLL header or a member of a process' SLL. These formats are now described.

G.01.00  
2- 12

Segment Locality Lists (SLL)

The system maintains for each process a segment locality list (SLL) of the segments belonging to that process' current working set. The process' SLL consists of a header and a list of entries. The header and list entries are taken from the SWAPTAB.

A process' SLL is located via the process' PCB entry. PCB01 contains the SLL relative index of the process' SLL header.

G.01.00  
2- 13

### SLL Header Format

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

																	PRE FETCH COUNT

SLL(SLLINX+0) NEXTIMPPIN, next nake present deferred queue  
PCB Index

SLL(SLLINX+1) NEXTINX, next SLL entry

SLL(SLLINX+2) PREVINX, previous SLL entry

SLL(SLLINX+3) SLL'OBJDESC, 1st word of object identifier

SLL(SLLINX+4) SLL'OBJNUM, 2nd word of object identifier

SLL(SLLINX+5)

- ```

(0:1)  MAPSEG, process's CST mapping segment (LSTI)
(1:1)  STAGE, process's state entry
(2:1)  DISKIOSEG, disk I/O pending on this segment
(3:1)  LOCKED, segment locked in memory
(4:1)  BLKLK, request for blocked lock
(5:1)  FROZE, request frozen in memory
(6:1)  SLIMI, process queued for this segment
(7:1)  TOS, toss this entry
(8:1)  FAREQ, request segment to be frozen
(9:1)  LKREQ, request to lock segment in memory
(10:1) DECCNTFLG,
(11:5) PREFETCHCOUNT,

```

**NOTE:**

The Swap Table will be configured with at least twice the number of configured PCBs.

G.01.00  
2- 15

## Special Request Table

Used for passing data segment size change info and for keeping a list of devices waiting for a segment to arrive in memory.

Z1042 - SRT relative index to entry # 0

X1043 - SRT relative index to the head of the queue

NOTE: The number of entries configured will be 3 greater than the number configured via SYSDUMP. (Entry #0 consumes 3 entries).

### SRT Entry 0 Format

|    |                                     |
|----|-------------------------------------|
| 0  | N ENTRIES CONFIGURED                |
| 1  | ENTRY SIZE (6)                      |
| 2  | N AVAILABLE ENTRIES                 |
| 3  | TABLE REL. INDEX OF 1ST FREE ENTRY  |
| 4  | TABLE REL. INDEX OF LAST FREE ENTRY |
| 5  | HIGH WATER MARK                     |
| 6  | N PRIMARY ENTRIES                   |
| 7  | HEAD OF IMPEDED QUEUE (PCB REL.)    |
| 8  | TAIL OF IMPEDED QUEUE (PCB REL.)    |
| 9  | N CURRENTLY IMPEDED PROCESSES       |
| 10 | N MAXIMUM IMPEDED PROCESSES         |
| 11 | CUMULATIVE N OF IMPEDED PROCESSES   |
| 12 |                                     |
| 17 |                                     |

G.01.00  
2- 16

The following entry format is for data segment size changes:

|   |                              |
|---|------------------------------|
| 0 | NEXT ENTRY FOR ORTR SEGMENTS |
| 1 | OBJECT IDENTIFIER            |
| 2 | NEW ORTR SEGMENT SIZE        |
| 4 | RERO DISPLACEMENT            |
| 5 | MOVE COUNT                   |

The following is the format for devices waiting on a segment: (The region header for the segment contains an SRT relative index to this entry. If more than 5 devices are waiting on this segment, another entry will be linked to this entry.)

|   |                                  |
|---|----------------------------------|
| 0 | NEXT ENTRY OF QUEUED DEVS ON SEG |
| 1 | IOQINX                           |
| 2 | IOQINX                           |
| 3 | IOQINX                           |
| 4 | IOQINX                           |
| 5 | IOQINX                           |

## NOTE:

The number of primary configured entries will be equal to the total number of LDEVs configured. The number of secondary entries will be configured to be at least the same as the number of PCBs configured. Data segment change entries are secondary type, while devices queued entries will be primary entries.

G.01.00  
2- 17

Main Memory Region Headers and Trailers

Main memory is partitioned into regions. Each region is in one of four states: available, reserved, assigned, or cached.

Rn available region is available for consumption by the free space allocation mechanism. Rn available region consists of neighboring subregions, each of which is either a hole or an overlay candidate. Rn available region is linked into the available region list.

R reserved region is a main memory region which is in the transition state from available to assigned. R reserved region has been cleaned, and there is a pending disc read of a segment into the region.

Resigned regions are occupied by present segments. Ravailable and reserved regions consist of one or more adjacent subregions. Region headers and trailers are partitioned into global and local components. The global region header/trailer is only valid for the first/last subregion in regions consisting of more than one subregion.

The region headers and trailers of available, reserved, and assigned regions contain the state and control information pertaining to the current or planned contents of the region.

Cache domains are another form of assigned regions and are designated as such in the subregion header. If the cache domain is "mapped" (I/O pending against it) then the object identifier will have a non-zero value in the second word of the segment identifier field. If the second word of the segment identifier field is zero, then this region is a cache domain that is unmapped. (Refer to Chapter 23 for further information regarding Disc Caching.)

G.01.00  
2- 18

Header length = 24  
Trailer length = 4

Global Region Trailer

| ARRTIME,  | Arrival time, contains the time at which the segment contained in the region became present                                                                                                                                                                                        |
| CACDRDISP | Valid only for regions containing a cached domain, this word represents the disc address ( in one word ) of the segment contained in the region. This word which exists in each member of a linked list of cached domains, is used as the target word during the LLSN instruction. |

## Space Allocation Structures

Rs of MPE V/P and V/E, one doubly linked list structure is used instead of the multiple lists ordered by size as in MPE IV. Sysglob locations X250 through X253 contain the respective head and tail (bank & address) of the available region list. These four words have in essence replaced the ARSRM and ARL data structures in MPE IV. Memory allocation and deallocation is handled through PUTONRRRL and TRXEOFFRRRL. The search for an available region of the desired size is done via the LLSN instruction. The format of the list is the following :

Sysglob X250 & X251 points to the absolute address of the NEXT LINK field (two words) in the first available region on the list. The NEXT LINK field in the first available region points to the absolute address of the NEXT LINK field in the second available region and so on. It is worth mentioning that in addition to having a NEXT LINK field, each available region also contains a PREVIOUS LINK pointer, which makes management of the list both easier and faster.

| 124 | HEAD   SECTOR           | 124 |

\* MEDIA TYPE is the device subtype for all serial volumes except cartridge tape. For cartridge tape, this field is always 0 (the HP 9110 subtype), despite a different actual cartridge tape subtype. This allows both forward and backward interchangeability of cartridges between the HP9110 and HP 9144.

| 3   | reassigned                         |   |   |   |   |   |   |   |   |   |    |    |    |    |     |     |                                 |  |

NOTE: The situation where there are two entries for the same track, n, one having a DTC of 0 (suspect) and the other having a DTC 3 (reassigned) results from a situation where the disc driver could not "read" (unreadable) the address of the particular track.

Unlike the DTT, entries in the DSCT are not permanent. Once a suspect sector is handled by INITIAL, SDISC, or VINIT, its entry is removed from the table. Thus, this table contains only unprocessed suspect sectors.

G.01.00  
3- 12

## Reserved Area Bit Map (Sector 4 of the System Disc)

The first 400 sectors of the system disc are reserved for Initial's use. This area contains permanent data structures for the boot. It is also used as a temporary storage area for data during spurring. All other system volumes and private volumes reserve only the first 10 sectors of the disc. They do not have a reserved area bit map.

The bit map contains 1 bit per sector. A '1' means the sector is free.

Cold Load Information Table Extension

The Cold Load Information Table Extension is a part of the Cold Load Information Table that has no use in booting the system. It exists for different system level processes to hold information that would only be created during a RELOAD. A good example of this is the system log file number. This is only created on a RELOAD, and changed whenever a log file is full or a boot (other than a RELOAD) is performed.

In order to protect the Cold Load Info Table, the extension was created. In this way NO I/Os should be performed to the Cold Load Information Table during MPE operation. However to process data into the Cold Load Info Extension a process must use the access routine "PROCESS'COLD'LOAD'INFO". The exact calling sequence can be found in KERNEL.

The Cold Load Information Extension is 2 sectors long and immediately follows the SYSDUMP/Initial Communication Record starting at sector address N31 on logical device 1.

The assigned entries are as follows:

|  |                                        |     |
|--|----------------------------------------|-----|
|  |                                        | 0   |

## Disc Layout

Virtual Disc Space Management Structures

Disc space for data segments is allocated from reserved regions of system volumes which have been assigned the virtual memory supporting (VMS) attribute. The data structure used for accounting and management of the virtual disc space of the various VMS volumes is the Virtual Disc Space Table (VDSMTAB). This structure consists of a circular list of entries, one for each VMS volume. Each entry contains the information defining the state of the virtual memory region on that volume.

## CHAPTER 4 DIRECTORY

## Introduction to the Directory

SYSGL08 celle:

DIRBASE <----absolute disc addr of base [SYSGL08+X130 RND X131]

Directory on disc consist of a contiguous area:

|              |                                                                       |                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DIRBASE ->   | DIRECTORY<br>BITMAP                                                   | The bitmap defines the available/used sectors in the directory. If the directory is <= 6112 sectors, then the bitmap will occupy 3 sectors. If the directory size is > 6112 sectors, then the bitmap will occupy 32 sectors with DIRBASE pointing to the 30th sector of the bitmap. A zero bit in the bitmap represents a used sector. Words 0 and 1 of the bitmap are ignored. |
| DIRBASE+3 -> | DIRECTORY<br>DATA<br><br>Entries<br>and<br>Indices<br><br>.<br>.<br>. | Directory entries contain pointers which are sector displacements relative to DIRBASE. Entries and indices are grouped into "blocks".                                                                                                                                                                                                                                           |

The capacities for accounts/groups/users/files are dependent on their block sizes.

|               |                                                      |
|---------------|------------------------------------------------------|
| * SYSSAIBSIZE | System acct index block size (3 sectors)             |
| * SYSAIIBSIZE | Acct. user index block size (1-3 sectors)            |
| * SYSAIBSIZE  | Acct. group index block size (1-3 sectors)           |
| * SYSGFIBSIZE | Group file index block size (2 sectors)              |
| * SYSGVIBSIZE | Group volume set definition ind. blk. size(1 sector) |
| * SYSAEBSIZE  | Acct. entry block size (3 sectors)                   |
| * SYSEBSIZE   | User entry block size (2 sectors)                    |
| * SYGEBSIZE   | Group entry block size (2 sectors)                   |
| * SYFEBSIZE   | File entry block size (2 sectors)                    |
| * SYVSEBSIZE  | Volume set definition entry block size (1 sector)    |
| * SYMABSIZE   | Maximum of above. (used to initialize DDS.)          |

\*These values are used once for the creation of the (root) system, account index or new systems. This root index is always at address DIRBASE+3.

## Directory

This section of the bit map DST is occupied by up to 3 sectors of bit map. It is swapped in 3 sectors at a time as needed. DS'FIRST'WORD is updated to search for space in the bit map. When it reaches DS'LAST'WORD for the second pass, the next 3 sectors of bit map will be swapped in.

Partial definitions:

- DS'LDEV = DS'BASE. (0:8)
- DS'DIRTY = DS'FLAGS. (0:1)

- DS'DIR'DISABLED = DS'FLAGS. (2:1)
- DS'PERM'DISABLE = DS'FLAGS. (3:1)

## Descriptions:

## DS'RODR

This is the address of the section of bit map that is currently in the buffers. For example, this address will usually be the same as DS'BASE. If we need to page in more sectors of bit map than the first three, then this address will be subsequently larger than DS'BASE.

## DS'BASE

This is the base address of the directory bit map. If the directory is greater than 6112 sectors, then this address will be 29 sectors less than the address found in the Cold Load Information table on disc.

## DS'CUR'SECTOR

This is the current bit map sector number of the first sector in the buffer area. Its value can range from 1 to 30. This number minus one added to DS'BASE will result in DS'RODR.

## DS'DIR'DISABLED

If this bit is on, the directory allocation and deallocation is off and only a WARNSTART will turn this bit off. The bit is turned on if an I/O error occurs on a directory bit map sector or if we find data integrity problems with the bit map, i.e. if we attempt to deallocate a sector that is already deallocated.

G.01.00  
4- 7

## Directory

## DS'DIR'SIZE

This is the size (sectors) of the directory area. This size includes only the last 3 sectors of the bit map. If the directory is greater than 6112 sectors, then this size does not include the extra 29 sectors of bit map. It can also be thought of as the number of bits in the bit map.

## DS'DIRTY

This bit is set if the bit map sectors in the buffer have been modified in any way. When more sectors must be brought into the buffers, or if we switch to a different domain (system to PV, PV to system) this bit is interrogated to determine if the sectors presently in the buffers must be first written to disc.

## DS'ERROR'LDEV

The LDEV in which the last directory error occurred.

## DS'ERROR'TYPE

This word describes the type of directory bit map error that occurred. Its legal values are:

- 0 - No error
- 1 - I/O error on a write
- 2 - I/O error on a read
- 3 - Attempting to deallocate space that is already deallocated
- 4 - Directory space management is already disabled

## DS'ERR'IN'PROGRESS

A directory space management error is currently in progress.

## DS'FIRST'WORD

R DST relative pointer to the word in the bit map buffer that we will interrogate next when directory space is needed. When the system first comes up, this word is always initialized to DS'HEADER+2 (i.e. to point to the first word in the bit map). On subsequent bit map sector reads, it is set to DS'HEADER since subsequent sectors will not have the 2 word overhead that exists in the first sector of the bit map.

## DS'FLAGS

This word contains numerous flags. See individual descriptions.

## DS'LAST'SECTOR

This is the total number of active bit map sectors. This number will range from 1 to 32.

G.01.00  
4- 8

## DS'LAST'WORD

This is the current number of bit map word in the buffer. It can range from 1 to X577 + DS'HEADER. If there exists 3 full sectors in the buffer, then it will have the value X600 + DS'HEADER - 1 or X621. It is compared to DS'FIRST'WORD to determine if we have hit the end of the current buffer area.

## DS'PERM'DISABLE

If this bit is set, then directory allocation/deallocating is permanently disabled. This bit should not be set.

## DS'REQ'SECTOR

This is the next sector to begin reading in up to 3 bit map sectors. It is updated by 2 or 3 and the read procedure will bring in up to 3 sectors starting from this sector. If this sector is set to be greater than DS'LAST'SECTOR, then it is reset to 1. After the sectors are read in, DS'CUR'SECTOR is set the DS'REQ'SECTOR.

## DS'SIZE

This is the size in words of the bit map buffer area. It is always a multiple of a sector (128 words). It will usually have the value of X600. Legal values are X200, X400 and X600.

## DS'SYS'LAST, DS'SYS'FIRST, DS'SYS'CUR &amp; DS'SYS'SIZE

The values of DS'LAST'WORD, DS'FIRST'WORD, DS'CUR'SECTOR and DS'SIZE will be stored in these locations when the directory space management switches from the system directory to a private volume directory. And, of course, when DSM switches back to system domain, the above mentioned values are reinitialized with these values.

G.01.00  
4- 9

## Directory Structure

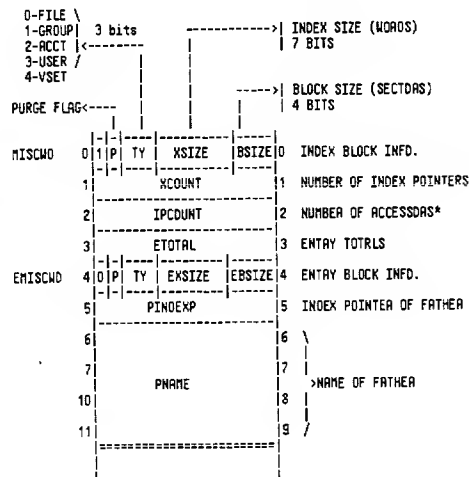

The Index Block prefix points back to the previous higher level. The Index Block entries point to the entry blocks.

G.01.00  
4- 10

## Directory Definitions

- >PAGE - smallest allocatable record ("phys.rec'd")-currently sector.
- >BLOCK - integral# of pages; contains contiguous indices or entries.
- >INDEX - pointer to entry block, containing name of 1st entry.
- >ENTRY - information-containing "object" may contain pointer to an index block.
- >POINTER - 15-bit positive relative page number (relative to directory base).
- >DDS - directory data segment.
- >ELEMENT - a generic name for index or entry.

## Index Block Prefix (10 Words)

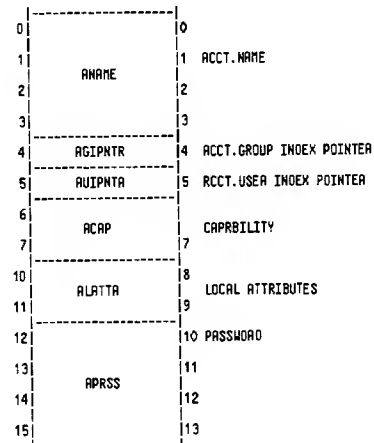

\*The count is incremented by each access that uses and relies upon a pointer to the index block, i.e., it is guaranteed not to be purged while the count is not = 0.

T - TYPE

- ```

1 - TYPE
0 = Volume Set Definition
1 = Volume Set Class
R - ALLOCATING FLAG
0 = not initially allocating (not 1st user of set)
1 = 1st user of set allocating resources (transitional)
MNTABX - Mounted Volume Table Index
0 if volume set not logically mounted

```

G V S I N F O

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
VOLCNT				NOT USED				VSMASK							

VOLCNT - Number of members in set  
VSMASK - Bit mask of volume member usage  
Order is from right to left  
i.e., bit 15 is 1st member, bit 14 is 2nd member ...

GVSVDLFLAG

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
NOT USED															

M - Member Mounted Flag  
0 = not mounted  
1 = mounted

## GVSVOLINFO

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
DISC								VTRBX							
PSEUDO SUBTYPE															

DISC PSEUDO-SUBTYPE = (Rctual type \*16) + actual subtype.  
VTABX - Volume Table Index

GVCINFO

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
VOLCNT				NOT USED				VCMASK							

### Volume Mask Format

- USED IN MYTAB, PVUSER, FILE CONTROL BLOCK (FCB), VOLUME SET/CLASS DEFINITION, VOLUME SET VTAB.
- 8-BIT MRSK.

Diagram illustrating the structure of the V register (8 bits) and its connection to VOLUMES 0 through 7:

Bit	Volume
V7	VOLUME 0 (MRSTER)
V6	VOLUME 1
V5	VOLUME 2
V4	VOLUME 3
V3	VOLUME 4
V2	VOLUME 5
V1	VOLUME 6
V0	VOLUME 7

Legend:

- 0: NOT MOUNTED OR NON-MEMBER
- 1: MOUNTED OR MEMBER

|              0              |3
|-----|-----|-----|-----|

|              PCB index of holder              |0      SIR locked
|-----|-----|-----|-----|
|              SIR QUEUE LENGTH              |1      (impeded processes)
|-----|-----|-----|-----|
|              HEAD OF IMPEDED LIST(PCB relative)              |2
|-----|-----|-----|-----|
|              TRIL OF IMPEDED LIST(PCB relative)              |3
|-----|-----|-----|-----|

```

P = PIN#  
PIN = PCB table entry number  
SIR QUEUE LENGTH- number of processes queued for this SIR

The SIR table is indexed by SIR#, with each SIR# corresponding to a unique, pre-assigned system internal resource. Entry 00 is not used. Impeded lists are established by using the SIR table entry (2) as the head of the list and PCB(15) for elements. PINs are always used as pointers, with 0 indicating end of list.

CHAPTER 6 FILE SYSTEM

This chapter describes the MPE V file system. The second section describes the basic concepts. The third section describes the table structures used.

File System Overview

I/O to files is done by reference to file numbers, which are assigned by calling the FOPEN intrinsic. This establishes an initial "point of attachment", which may be described as a connection between a program (i.e., process) and that particular point in a particular file at which the next FREAD or FWRITE would cause data to be transferred. A point of attachment is described by a control block, of which there are several different kinds (described later). Control blocks may exist in the process's own stack or in an extra data segment assigned by the file system. In order to find control blocks quickly, a pointer scheme called vectors is used. A control block is uniquely described by a vector, which consists of two words with the first word containing a segment number and the second word containing a word offset into the control table of the vector table entry which describes the location of the control block within that segment. The entire assemblage, consisting of eight overhead words, the vector table, and all of the control blocks to which it points, comprises the entire segment; if in a stack, it occupies part of the PXFILE part of the PCB.

The point of attachment is described by a "physical access control block", or PRCB, which will exist as a result of an FOPEN to any file (except \$NULL). Any required I/O buffers are associated with the PRCB; refer to Section 2.1.

All FOPENs specifying "multi-access" for all processes running under a single job use a single PRCB for references to a multi-access file. Although all these are attached to a single point in the file, the type of attachment (i.e., ROPTIONS) may be different. So, each FOPEN specifying a multi-access file establishes a "logical access control block", or LACB, which contains the point-of-attachment local values. The use of a single buffer (i.e., PRCB) ensures that references by various processes or against various FOPENs within one process are dealt with in strict sequential order. Note that references to a file by other jobs, or by other processes not specifying multi-access, will be through other PRCBs, whose buffers will be read or written at the pleasure of the file system; in order to ensure any sort of coherence to such shared references, the jobs must use global RINS and FLOCK and FUNLOCK the file. \$STDIN, \$STDLIST, and spoolfiles are opened multi-access automatically.

In the case of disc files, there is another kind of control block: the file control block (FCB). It contains copies of information read from the file label, such as the end-of-file pointer, the extent map, and the record and block structure. The EOF pointer is updated in the FCB as the file is written, and all changes made to the FCB are posted to the file label when the file is closed. An FCB is shared by all jobs in the system which reference the file.

G.01.00  
6- 1

## File System

Table Formats

This section gives a detailed discussion of the main tables constructed and used by the file system. The location and overall structure of each table is given, in addition to the table format and a discussion of each field in the table. Table indices at the right of the table are in octal. Index names apply to the entire word; if in parentheses, the names are defined in the file system listing but not explicitly used there.

File System Section of PCBX (PXFILE)

The PXFILE area is a subsection of the PCBX. It is a contiguous, expandable and contractible block of storage that is managed by the file system primarily for its own use. Other subsystems, namely CS and DS, also make use of the PXFILE section. In doing so they must conform to the conventions of the file system.

The overall structure of the PXFILE area is:

OVERHEAD	(FIXED)
CONTROL BLOCK TABLE	(VARIABLE)
AVAILABLE	(VARIABLE)
ACTIVE FILE TABLE	(VARIABLE)
	DL-5

G.01.00  
6- 3

The file number assigned by an FOPEN is an index into the Available File Table (AFT), a table of six-word entries which is at the end of the PXFILE part of the PCBX. Two double words are vectors to the PRCB and (if it exists) the LACB.

AFT entries can also reside in a global AFT extra data segment. If the file was opened Global AFT (specified in the ROPTIONS) and the program is privileged, then the AFT is placed into this global AFT DST. Any accesses to the file are identical to local AFT's. All accesses to the file opened global must be done from privilege mode code. The file system intrinsic distinguish this file by a negative file number. Again, these files are identical in every other way except for where the AFT entry resides.

Because control blocks are shared among processes, it is necessary to have a scheme for coordinating access to them. A control block is "locked" by a process which requires exclusive access to it for a time. Other processes which attempt to lock the block will find it already locked, and will be impeded and queued. It may also be necessary to lock an entire control block table so that a process can create or destroy a control block in it, or lock or unlock an existing control block in the table.

Another table used by FOPEN is the File Multi-Access Vector Table (FMAVT). This table exists in a system extra data segment and is used by all jobs and processes in the system. When a file is being FOPENed with multi-access specified, the FMAVT is searched; if the file is already open, the FMAVT gives the PRCB vector for the prior reference for each job.

Buffers

A bit in ROPTIONS specifies, when a file is opened, whether access is to be buffered or unbuffered. If unbuffered, data is transferred directly between the I/O device and the user's buffer (usually in his stack), which will be frozen in memory for the duration of the transfer. If buffered, the data is moved between the user's buffer and a file system buffer to which the I/O is actually done.

Buffers are associated with the PRCB, attached to it as an appendage.

G.01.00  
6- 2

## File System

Overhead

The part labeled Overhead contains information that pertains to the entire section. It is addressed via the pointer at DL-3.

0	1	7	8	15
PXFILE SIZE IN WORDS				
LAST DOPEN ERROR NO.   LAST COPEN ERROR NO.				0 PXFSIZE
N				1
LAST DS RFT				2
SLAVE RFT NUMBER				3
LAST XOPEN ERROR NUMBER   LAST FOPEN ERROR NUMBER				4
AFT SIZE IN WORDS				5
CS TRACE FILE INFO				6 PXFRTSIZE
LAST RESPONDING NO-WAIT I/O RFT ENTRY NUMBER				7 (PXCTRAINFO)
1ST USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				8
2ND USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				9 PXFLEFTOFF
3RD USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				10 PXFCBT1
4TH USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				11 (PXFCBT2)
5TH USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				12 (PXFCBT3)
6TH USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				13 (PXFCBT4)
7TH USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				14 (PXFCBT5)
8TH USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				15 (PXFCBT6)
				16 (PXFCBT7)
				17 (PXFCBT8)

Partial word field identifiers are:

PXFDOPEN = PXFILE(1).(0:8)W, last DOPEN error code  
 PXFCOPEN = PXFILE(1).(8:8)W, last COPEN error code  
 PXFNOCB = PXFILE(2).(0:1)W, no CB's in PXFILE CBT?  
 PXFXOPEN = PXFILE(5).(0:8)W, last XOPEN error code  
 PXFFOPEN = PXFILE(5).(8:8)W, last FOPEN error code

G.01.00  
6- 4

## Discussion:

PXFAFTSIZE	This is the size (in words) of the Active File Table (AFT). The size is in words to simplify calculating the size of the available block.
PXFCBT1-8	These are the DST numbers of the user (NOBUF) control block tables. A DST number of 0 indicates that no data segment is allocated.
PXFCOPEN	This contains the last COPEN error number. Not used by the file system.
PXFCTRINF	This contains information pertinent to the CS trace file. Not used by the file system.
PXFCDOPE	This contains the last DOPEN error number. Not used by the file system.
PXFDISINF	Reserved for DS. Not used by the file system.
PXFFOPEN	This contains the last FOPEN error number. If it is zero then the last FOPEN successfully completed; otherwise the last FOPEN was unsuccessful and the number is the file system error number.
PXFKOPEN	This contains the last KOPEN error number. KSM is partly embedded in the file system, and an FOPEN failure on a KSM file can be caused by a failure to open either the key file or the data file. This error number is used in conjunction with PXFFOPEN to determine which file caused the KSM open failure. This error number is not used by the file system.
PXLEFTOFF	This is the AFT entry number of the last file/line that completed a nowait I/O; if zero then no nowait I/O has been completed. This cell is maintained solely by and for the IOWAIT intrinsic.
PXFNOCB	This bit signifies that control blocks are not to be created in the PXFILE control block table. This bit is set by the NOCB parameter to the CREATE intrinsic or the :RUN command. This feature permits the user to have as much stack space as possible; otherwise the file system will take several hundred words of stack for the PXFILE control block table.
PXFSIZE	This is the size (in words) of the complete PXFILE area. It is the sum of the overhead block, the control block table, the active file table and the available block.

G.D1.00  
6- 5

## PXFILE Control Block Table (PXFCBT)

Addressing within a PXFILE control block table is somewhat more complicated than addressing an extra data segment CBT since the table does not begin at DB=0. As a result all pointers within the table are table relative; the starting address of the table must be added to a pointer to generate a final DB-relative address. This addressing convention is consistently applied to all control block tables.

When the control block table is expanded, space is taken from the AVAILABLE area. If no space is available then the PXFILE area is expanded and the acquired space is added to the AVAILABLE area.

## Available Block

The part labeled Available is used to provide space when the Control Block Table or the Active File Table is expanded. These two tables grow towards each other, and when more space is needed it is simply taken from the Available Block.

When the Available area is exhausted, the PXFILE area is expanded, the AFT is relocated and the new space is added to the Available Block.

Currently the PXFILE area is only expanded; it is never contracted.

G.D1.00  
6- 6

## File System

## Active File Table (AFT)

The part labeled Active File Table contains information used by the file system (or CS, DS, etc.) to grossly characterize the file access and, most importantly, to give the location of the control blocks.

The overall structure of the AFT is:

where  $N = \text{PXFAFTSIZE}/6$ .

The length of the AFT is specified by PXFAFTSIZE. Unused entries are all zeros. When the table is full it is expanded by taking space from the Available block.

The AFT is negatively indexed by file number: the entry at DL-9 corresponds to file number 1, the entry at DL-15 corresponds to file number 2, etc.

The structure of the global AFT DST, described in Section 2 is as follows:

G.D1.00  
6- 7

## File System

The structure of a file system AFT entry is:

0	1	2	3	4	5	15
ENTRY TYPE	N					0
	PHYSICAL ACB DST NUMBER					1 AFTPCBOST
	PHYSICAL ACB ENTRY ADDRESS					2 AFTPCBENTRY
	LOGICAL ACB DST NUMBER					3 AFTLACBOST
	LOGICAL ACB ENTRY ADDRESS					4 AFTLACBENTRY
	NO-WAIT I/O IOCK					5 AFTIOCK

The entry format depends on the entry type; the file system uses entry type 0.

The following partial word field identifiers are used:

AFTTYPE	= AFT.(0:4)N,	entry type
AFTNULL	= AFT.(4:1)N,	NULL file

## Discussion:

**AFTIOCK** This is the IOCK index of the pending nowait I/O (if any). This is applicable if the file was opened with the NOWAIT option specified. Also, CS and DS have the same capability and use this cell in a consistent manner. This is because the IOWAIT intrinsic services the file system as well as CS and DS, and is the principal user of this call. If the IOCK is negative, then one of two possibilities exist. If the file is a message file, then file IOCK is the accessor's reply port. If the file is a standard APE file, then a read was done to a nonexistent extent and this is simply a stub inserted by the file system.

**AFTLACBOST** This is the DST that the Logical ACB (LACB) if it exists. This is applicable if the file was opened with the multi-access option specified.

**AFTLACBENTRY** This is the word offset into the control block table of the LACB vector table entry, applicable if the file was opened with the multi-access option specified.

**AFTNULL** This bit signifies that the file is NULL and that there are no control blocks.

G.D1.00  
6- 8

AFTPCBDST This is the DST that contains the Physical ACB (PRCB). A PRCB exists for all files except \$NULL.

AFTPCBENTRY This is the word offset into the control block table of the PRCB vector table entry. This will be nonzero for all files except \$NULL.

AFTTYPE This is the AFT entry type number. At present the following entry types are defined:

- 0 - file system
- 1 - remote file
- 2 - DS (nowait I/O disallowed)
- 3 - DS (nowait I/O allowed)
- 4 - CS
- 5 - CS
- 6 - KSRM
- 8 - Message File

## Remote file AFT entry:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
FSTYPE															MA
UNUSED															
LINE NUMBER															
REMOTE FILE NUMBER															
PENDING FCLOSE DISPOSITION FROM FOPEN															
UNUSED															
IDQX															

AFT 0 FSTYPE - This value will be 1 for remote files.  
MA - Set if the file was opened multi-access.

AFT 1 - Local line number of remote file.

AFT 2 - File number of the remote file.

AFT 3 - Pending disposition of the file. Set when file was FOPEN'd and will possibly be used as the FCLOSE disposition.

AFT 5 - No wait I/O Queue Index.

G.01.00  
6- 9

## DS AFT entry:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
FSTYPE				C   H   P   R				OS ERROR NUMBER							
DATA SEGMENT NUMBER															
OSOCB INOEX								UNUSED							
LOEV NUMBER															
PREVIOUS APT POINTER															
IDQX															

AFT 0 FSTYPE - This field will have the value 2 or 3.  
C - On if DSOPEN called by CXOSLINE or REMOTE'HELLO.  
M - On if Master PTDP AFT.  
P - On if PTDP related.  
R - On if remote main process.

AFT 1 - DS data segment table pointer.

AFT 2 - OSOSCB Index - OS data segment control block index.

AFT 3 - Logical device number.

AFT 4 - Preceding OS open AFT Pointer.

AFT 5 - IDQX - Same as described above.

G.01.00  
6- 10

## CS Line entry:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
FTYPE															UNUSED
LOGICAL DEVICE NUMBER															
VECTOR TO MULTIPLE IDQ INDICES															
TR															UNUSED
MISC'DST															
IDQX ( CID only )															

AFT 0 FTYPE - This value will be 4 or 5. A 5 signifies that the line has an autodialer attached.  
W - The line has been opened with no waiting on I/O requests.  
ID - Line is a multipoint control or 3270 station.  
B - Line was opened with buffering.

AFT 1 - Logical device number of the line.

AFT 2 - Vector to Multiple IDQ indices.

AFT 3 TR - Bit 0 on signifies tracing enabled. Bit 1 on signifies trace all.  
I - On if line is currently connected.  
R - Signifies that this CS device is an SCCP device.  
DIAL - 0 = Dial on write, answer on read.  
1 = Answer on write, dial on read.  
2 = Always dial.  
3 = Never dial.

AFT 4 - DST number of the line's misc data segment.

AFT 5 - If > 0, then it is the system DB address of a single request IDQ entry. IDQWAIT uses this word to pass the IDQ index of the completed request for this AFT to CSIDWAIT.

G.01.00  
6- 11

## File Control Block Table (CBTAB)

A file control block table can be located in two places: (a) as a subpart of the PXFILE area, as discussed in Section 3.1.2; or (b) in a data segment. Although putting control block tables in PXFILE has the advantage of providing rapid access, it detracts from the space for the user's stack; so the larger control blocks (or optionally, all control blocks) are put into extra data segments. On the other hand, referencing extra data segments may result in an absence trap, which is slow. Extra data segment control block tables are of three kinds: expandable, nonexpandable, and shared FCB. Nonexpandable CBT's are used for a single PRCB with buffers, i.e., where the control block is large or where the control block can't be local to a single process (for multi-access). Expandable (or MODBUF) CBT's are used for small control blocks, as LACB's, PRCB's with no buffers, and FCB's which are local to a single process. A list of the expandable CBT's associated with a process is kept in the overhead area of PXFILE (cf. Section 3.1.1). When a small control block is needed, these CBT's are checked in order to see if one of them has room. Shared FCB CBT's are similar to expandable CBT's except that they belong to the system rather than to a single process; the system keeps a list of OST's which it has assigned for this purpose.

The overall structure of a control block table is:

OVERHEAD	(FIXED, 8 WORDS)
VECTOR TABLE	(VARIABLE)
CONTROL BLOCK AREA	(VARIABLE)

G.01.00  
6- 12

Overhead

The part labeled Overhead contains information pertaining to the entire table.

0	1	2	6	7	15
TABLE SIZE IN WORDS					
DST NUMBER CONTAINING TABLE					
TYPE   VECTOR TABLE SIZE IN WORDS					
LOCK PIN					
L					
IMPEDED QUEUE HEAD					
IMPEDED QUEUE TAIL					
UNUSED					

Other identifiers used:

CBTTYPE = CBTAB(2).(0:2) Control block table type  
 CBTVSIZE = CBTAB(2).(2:14) Vector table size  
 CBTLOCKBIT = CBTCONTROL(0:1) Lock bit

Discussion:

**CBTOSTX** This is the DST number of the data segment that contains the control block table. If the table is contained in a etack, i.e. in the PAFILE area, then this is the DST number of the etack and not 0.

**CBTLOCKBIT** If the entire control block table is locked, then this bit is set. No locking count is kept since control blocks are locked only once from FCRETECB and FDELETECB when control blocks are added to and deleted from the table. The procedure LOCK\*CB does not lock the control block because it runs PSEUDOLOCKED during the critical times.

**CBTQUEUE** This is the impeded queue for the table and has the same format as the impeded queue for a control block in the table. There is no second impeded queue because that facility is used exclusively for BREAK requests against the PCB for \$STDIN/\$STDLIST.

G.01.00  
6- 13

**CBTPIN** This is the PIN number of the process that has the control block locked.

**CBTTYPE** This is the size in words of the table. It is initialized when the table is created and changed when the table is expanded. At present a table is never contracted, even though this is possible.

**CBTTYPE** This field is the type of the control block table. Possible values are:

- 0 - etack [PAFILE]
- 1 - NOBUF (expandable)
- 2 - System shared FCB
- 3 - Buffered (Contains a single PRCB)

**CBTVSIZE** This is the size, in words, of the vector table area in the control block table. It does not reflect the number of entries used or unused.

**NOTE:** All PIN's are kept as the word offset into the PCB table and as the actual PIN number.

G.01.00  
6- 14

Vector Table

The part labeled Vector Table contains information used to locate and lock or unlock control blocks in the control block table.

The overall structure of the vector table is:

ENTRY 0	(FIXED, 8 WORDS)
...	
ENTRY N	(FIXED)

where N = (CBTVSIZE/8)-1.

An unused vector table entry will have zeros in all the words of the entry. A used vector table entry will have a nonzero value in the first word of the entry (the control block address is necessarily nonzero).

The general structure of a vector table entry is:

D	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
CONTROL BLOCK ADDRESS															
L   0		COUNT								UNUSED					
LOCK PIN															
HIGH PRIORITY HEAD PIN															
HIGH PRIORITY TAIL PIN															
LOW PRIORITY HEAD PIN															
LOW PRIORITY TAIL PIN															
UNUSED															

0	VT*ADR
1	VT*CONTROL
2	VT*PIN
3	VT*DHEND
4	VT*DTAIL
5	VT*SAVEDHEAD
6	VT*SAVEDTAIL
7	

G.01.00  
6- 15

The following partial word identifiers are used:

VT'LOCK'BIT = VT'CONTROL.(0:1)  
 VT'BREAK'BIT = VT'CONTROL.(1:1)  
 VT'COUNT = VT'CONTROL.(2:6)

Discussion:

**VT'ADR** Control block address is the table relative address of the control block associated with the vector table entry. It is a word displacement from the beginning of the control block table.

**VT'BREAK'BIT** This bit signifies that we are in the middle of break mode. This is used for the PCB of \$STDIN/\$STDLIST from a terminal session only.

**VT'LOCK'BIT** This bit is set whenever the control block is locked.

**VT'COUNT** This is the count of the number of times that the control block has been locked by the process identified in VT'PIN. If it is zero, then the control block is not locked.

**VT'PIN** Contains the PIN of the process which has exclusive access to the control block. Other processes attempting to access the block will be impeded and queued.

**VT'QUEUE** The high priority impeded queue is a double word of PINs that are the head and tail of the impeded queue of processes waiting for access to the control block. Processes are impeded and unimpeded by the file system using the normal mechanisms available under MPE.

**VT'SAVEDQUEUE** The low priority impeded queue is a double word of PINs and has the same format as VT'QUEUE. The only time this word is used is when the control block is in BREAK mode, which can only happen to an ACB corresponding to \$STDIN/\$STDLIST. It is used to save the current VT'QUEUE when the control block goes into BREAK mode and to restore VT'QUEUE when the control block goes back into non-BREAK mode.

**NOTE:** All PIN's are stored as offsets within the PCB table and not as actual PIN numbers.

G.01.00  
6- 16

Control Block Area

The part labeled CONTROL BLOCK AREA contains the control blocks used by the file system.

To facilitate storage management, all control blocks have the same overall structure:

where  $N = \text{Size} - 1$ .

Partial word field identifiers are:

CBTYPE = CB.(0:2)N; control block type number.  
CBSIZE = CB.(2:14)N; control block size

Discussion:

CBDESCRIP This is the first word of a control block; the format is common for all control blocks.

CBSIZE This is the size (in words) of the control block. The size includes the descriptor word.

CBTYPE This is the type number of the control block. There are four types of control blocks:

0 - Garbage 1 - FCB 2 - PRCB 3 - LACB

When a control block table is created the initial control block area is completely allocated to a single control block of type garbage. When space is requested for a new control block the control block area is scanned (using a first fit algorithm) for a garbage control block that is as large as the size requested. The space for the new control block is taken from this garbage control block and the space remaining becomes the new garbage control block size.

G.01.00  
6- 17

When space is returned it becomes a new garbage control block. To reduce fragmentation the new garbage control block is combined with either of the two neighboring control blocks if they are of type garbage.

If space is requested and no garbage control block is large enough to contain the new control block then the control block area and control block table are expanded by a sufficient amount. If expansion is not possible, some other control block table must be used.

Access Control Block (ACB)

Virtually every file system intrinsic constructs an ACB as its first action. When using the multi-access option, each accessor shares a single PRCB. However each accessor is permitted to view the shared file in a slightly different manner than the other accessors. For example, one accessor may access the file in a read-only mode while the other accessors may access the file in a read-write mode. To do this, each accessor must, during its access, have a slightly different ACB.

The PRCB holds information that is global to all accessors of the file. The LACB holds information that is local to each accessor of the file. At the beginning of a particular access, an ACB is constructed by calling LOCACB, which copies information from both the LACB and the PRCB. At the end of the access, the ACB is released by calling UNLOCACB; this updates the PRCB and LACB from the ACB since some of the fields may have been modified due to the access. This scheme nearly eliminates EXCHANGEGB's to access the various data segments.

G.01.00  
6- 18

Logical Access Control Block (LACB)

All LACBs have the same structure:

Partial word field identifiers are:

LACBSIZE = LACB.(2:14)N, size in words  
LACBSTOPCHRR = LACB.(2).(0:8)N, terminal stop character

Discussion:

LACBROPTIONS See ACBROPTIONS.

LACBSIZE See ACBSIZE.

G.01.00  
6- 19

LACBCTL See ACBCTL.

LACBERROR See ACBERROR.

LACBFNUM See ACBFNUM.

LACBFOPTIONS See ACBFOPTIONS.

LACBMODE See ACBMODE.

LACBNAME1-B See ACBNAME.

LACBPRCB This is the OST and vector table entry for the Physical ACB (PRCB) for the file.

LACBSIZE See ACBSIZE.

LACBSIZE This is the size, in words, of the LACB. All LACBs are eighteen (decimal) words long.

LACBSTATE See ACBSTATE.

LACBSTOPCHRR See ACBSTOPCHRR.

LACBLOG See ACBLOG.

G.01.00  
6- 20

The overall structure of the PACB is:

1. No buffers; the buffering extension is not present.
2. PCB buffers; the buffering extension is present and the buffers are in the buffering extension.

If multiple PCB buffers exist, there will be a buffering extension for each, immediately preceding the buffer. The basic PCB (or NOBUF PCB) is copied into the the ACB as words 0 through X63; an ACB "extension" is then generated in words X64 - X67. The resulting ACB thus has the following format:

G.01.00  
6- 22

## File System

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

The above words, 0-X63, are physically located in the PRCB of the file. Below, words X64-X67, are used by file system intrinsics- and are placed onto the stack by the procedure LOC'PCB when locking the PCB. Therefore, the buffering extension, if present, will immediately follow word X63 of the actual PCB in the Control Block Table of the file.

## Discussion:

ACBTRFCT This flag is used to abort a broken terminal re-read. The flag is set via the RORT parameter to FUNBREAK. If the flag is set then the RORT PENDING message will be aborted along with the re-read. This feature is needed to handle the BREAK...:ABORT, etc. situation.

ACBTRFCT This is the access class part of the device type number. The following are legal values:

- 0 - direct (e.g. disc)
- 1 - serial input (e.g. card reader)
- 2 - parallel input/output (e.g. terminal)
- 3 - serial input/output (e.g. magnetic tape)
- 4 - serial output (e.g. line printer)

ACBTRFCT This is the access bit map for the file. The following are the bit definitions of this eight-bit field:

- (0:1) - unused
- (1:1) - unused
- (2:1) - read
- (3:1) - append
- (4:1) - write
- (5:1) - lock
- (6:1) - execute
- (7:1) - save

This access security is determined by the ACCCHECK intrinsic and enforced by the file system.

ACBTRFCT This is the RDICTIONS in effect for this file access.

ACBTRFCT This bit controls full eight bit transfers on the 2644 page mode terminal. It is adjusted by FCONTROL(26) and FCONTROL(27).

ACBTRFCT This is the block number of the current variable record format block. Applicable if the record format is variable.

ACBTRFCT This is the blocking factor for the file. It is the number of records in a block. Legal values range from 1 to 255.

G.01.00  
 6- 26

## File System

ACBTRFCT This is the break mode flag. It is applicable if the ACB is for \$STDIN or \$STDOUT. If set it means that the BREAK key has been hit and that the CI should have high priority access to the ACB. The flag will be cleared when a RESUME or RORT is issued.

ACBTRFCT This is the block size, in words, of the file.

ACBTRFCT This is the total number of blocks transferred to and from the file. The initial value is 00.

ACBTRFCT This is the word index, relative to the base of the block, for the selected record within the block. This is applicable if the file access is buffered.

ACBTRFCT This bit signifies that the file has carriage control. It is the same as the carriage control bit in ACBTRFCT if the file is spooled. If not spooled, the bit is zero, and IODD will pass the FWRITE carriage control parameter directly to the driver rather than embedding it as the first character of the output record.

ACBTRFCT This is the CONTROL parameter from the last FWRITE. This value is pertinent if the file was opened with carriage control.

ACBTRFCT This is the buffer number (0-relative) containing the most recently referenced record. Applicable if the file access is buffered.

ACBTRFCT This is the logical device number of the file. For a disc file this is the logical device number of the first extent.

ACBTRFCT This bit signifies that the file is to be accessed with default blocking. The bit is initialized from the FOPEN stateword STATE. It does not need to be in the ACB; it is mentioned here only to signify that the bit is effectively used due to the way ACBSTATE is initialized from STATE.

ACBTRFCT This is the file close disposition derived from the FOPEN call. The only way this can be specified is via a file equation. The legal values are the same as those for FCLOSE.

G.01.00  
 6- 27

## File System

ACBTRFCT This is the file reference format type number and is derived from the FOPEN call. The following are legal values:

- 0 - full name
- 1 - account name absent
- 2 - group and account name absent
- 3 - null name

This information is needed by FRENAME.

ACBTRFCT This is the device type number of the file. The following are legal values (octal):

- 0 - moving head disc
- 1 - fixed head disc
- 7 - foreign disc
- 10 - card reader
- 11 - paper tape reader
- 20 - terminal
- 24 - card reader/interpreter/punch
- 26 - SSLC
- 27 - programmable controller
- 30 - magnetic tape
- 31 - serial disc
- 40 - line printer
- 41 - card punch
- 42 - paper tape punch
- 43 - CALCOMP 500 plotter
- 44 - CALCOMP 600 plotter
- 45 - CALCOMP 700 plotter

ACBTRFCT This bit is set when EDF has been sensed.

ACBTRFCT This is the type of EDF detected on \$STDIN(X). This field consists of two bits:

- (0:1) - super colon (i.e. EDF for \$STDIN(X))
- (1:1) - regular colon (i.e. EDF for \$STDIN(X))

Applicable for multi-access to \$STDIN(X) only.

ACBTRFCT This is the error number for the file. It is used by all intrinsics except FOPEN. When an error is detected the error number is placed in this cell. The error number is cleared at the beginning of each callable intrinsic except FCHECK (which reads it).

ACBTRFCT This is the FCB vector for the file. Applicable only to disc files.

ACBTRFCT This bit controls the definition of the f1 and f2 function keys on the 2644 page mode terminal; it is

G.01.00  
 6- 28

## File System

	adjusted by FCONTROL(32) and FCONTROL(33). (Obsolete function)
ACBFNUM	File number, range from 1 to 255. Used mostly for calling routines that access things such as labels by file number.
ACBFOPTIONS	This is the FOPTIONS in effect for this file access.
ACBFPTR	This is the sequential access record pointer; it contains the next sequential record number. The initial value is 00. This value is used only by the FREAD, FWRITE and FUPDATE intrinsics. However, the value is maintained by all data transferring file system intrinsics.
ACBFNVTX	This is the entry index into the file multi-access vector table (FNVT). This is valid if the file access is multi-access.
ACBGSTATE	These are miscellaneous state flags. These are "global" in nature in that they are the same for all accessors in a multi-access environment. The constituent bits are described individually.
ACBGSTATUS	This is the general part of the last I/O status for the file. The following are the legal values: 0 - pending 1 - successful 2 - end of file 3 - unusual condition 4 - irrecoverable error
ACBHIBLK	This is the highest block number for which an anticipatory read has been issued, and is applicable if the file access is buffered. The initial value is -10.
ACBHIT	This is the buffer hit flag. If set it indicates that the last read or write request was serviced without any physical I/O required. This flag is used only for performance measurement. The code which manipulates it is optional to the file system, and is controlled by compiler toggle K3.
ACBINHIBCALF	This bit controls the termination of lines written to the terminal. If not set then each line is terminated with a CR and LF; if set then no line termination characters are used. This bit is valid if the file is a terminal file; it is adjusted by FSETMODE.
ACBLINECTL	This is the line control bit. If not set then each line is post-spaced; if set then each line is pre-spaced. This bit is used by line printers and terminals only. It is adjusted by FCONTROL(1) and FWRITE with the appropriate carriage control.

G.01.00  
6- 29

## File System

ACBLPCTL	This are the line and page control bits, which are described separately.
ACBLSTATE	These are miscellaneous state flags. They are "local" in nature in that they may be different for each accessor in a multi-access environment. Bits (9:6) are initialized from the stateword local variables called STATE in FOPEN; the ten remaining bits are initialized individually. The constituent bits are described individually.
ACBNODE	These are miscellaneous node flags. The constituent bits are described individually.
ACBNMNE	This is the local file name. The name is eight bytes in length with trailing blanks added.
ACBNMNEOF	This flag when set indicates that a new tape mark should be written before the tape is rewound or backspaced. Applicable only to magnetic tape files.
ACBNWRITEOF	This bit is used to save the value of the local EOF advanced flag NMNEOF in IOMOVE between the I/O initiation and I/O completion calls. This flag is applicable if the file is accessed in nowait I/O mode.
ACBNWRITEMODE	This cell is used to save the I/O mode between nowait I/O initiation and completion calls. If the bit is set then the last I/O request was a write; otherwise it was a read. This cell is pertinent if the file is accessed in nowait I/O mode.
ACBNMBUFS	This is the number of buffers, less one, used for the file access. Applicable if the file access is buffered.
ACBPAGECTL	This is the page control bit. If not set then a page is assumed to consist of 60 lines (auto page eject); if set then a page is assumed to consist of 66 lines (no auto page eject). This is used primarily for line printers but is also valid for terminals; these are the only devices for which this is valid. This bit is adjusted by FCONTROL(1) and FWRITE with the appropriate carriage control.
ACBPRIV	This flag when set indicates that the file is privileged in that it has a negative file code; the user must be in privileged mode to access it.
ACBQSTATUS	This is the qualifying part of the last I/O status for the file. The values are unique for each general status part. See I/O System IHS for all legal values.
ACBQUTESCE	This bit controls critical output verification. If set, buffered output is guaranteed to have been written to the

G.01.00  
6- 30

## File System

	device when control is returned to the user. This bit is adjusted by FSETMODE.
ACBREARCODE	This field consists of the input EOF checking type and mode, and is used to generate the P1 parameter to ATTACHIO. These fields are described individually.
ACBREARMODE	This field controls the input EOF checking mode. It is 00 for reading \$STDIN, 01 for reading \$STOIN, and 10 for the command interpreter.
ACBREARTYPE	This field controls the input EOF checking type. It is 01 for JOBS, 10 for SESSIONS, and 00 for DATA.
ACBRASIZE	This is the file's record size in positive bytes.
ACBRFRCT	This is the total number of records transferred to and from the file. The initial value is 00.
ACBSAVEEOF	This field is used to save the contents of ACBEDFS during BREAK mode processing.
ACBSHCNT	This is the total number of LACBs that exist for this PACB. Valid if the file access is multi-access.
ACBSHCNTIN	This is the total number of input-only LACBs that exist for this PACB. Valid if the file access is multi-access.
ACBSHCNTS	This is the total LACB and total input-only LACB counts, each of which is described separately.
ACBSIZE	This is the size, in words, of the ACB. The complete size (including buffers) may be calculated from the DST size containing the PACB. It does not include the buffering extension, if present.
ACBSPROPT	This is the FOPTIONS for the spooled device. Applicable if the file access is to a spooled device.
ACBSFPROPT	This is the FOPTIONS for the spooled device. Applicable if the file access is to a spooled device.
ACBSPOOLED	This is the spooled device flag. If set then the file access is to a spooled device.
ACBSPOOLIO	This field is a combination of the spooled device flag and the input/output mode of the spooled device. Legal values are: 00 - not spooled 01 - illegal 10 - input spooling 11 - output spooling

G.01.00  
6- 31

## File System

ACBSPREC	This is the record size, in bytes, of the spooled device. Applicable if the file access is to a spooled device.
ACBSPTYPE	This is the device type (from the LDT) of the spooled device. Applicable if the file access is to a spooled device.
ACBSPTYRC	This cell contains the spooled device type and record size, which are described separately.
ACBSPVDEV	This is the logical device number of the spooled device. Applicable if the file access is to a spooled device.
ACBSPHOOK	This is the index into the IDO or ODD for a spoolfile. Applicable if the file access is to either a spooled device or a spoolfile.
ACBSTATUS	This is the last I/O status for the file. It comes from the I/O status part of the IOCB returned by ATTACHIO. Not all ATTACHIO calls update this cell.
ACBSTOPCHAR	This is the record termination character used for terminal reads. This character can be changed via FCONTROL(25).
ACBSTAERN	This bit signifies inter-block garbage for disc files. If set, the block size is a multiple of 128 words and therefore there is no garbage data between blocks. This fact is used to improve multirecord I/O by mapping the request into as few ATTACHIOs as possible.
ACBSUBCL	This is the sub-class part of the device type number. The sub-class is unique for each access class. The following are the legal sub-class values for each device class: 0 - direct 0 - moving head disc 1 - fixed head disc 7 - foreign disc 1 - serial input 0 - card reader 1 - paper tape reader 2 - parallel input/output 0 - terminal 4 - card reader/punch 6 - SSLC 7 - programmable controller 3 - serial input/output 0 - magnetic tape 7 - serial disc 4 - serial output

G.01.00  
6- 32

0 - line printer  
 1 - card punch  
 2 - paper tape punch  
 3 - CALCOMP 500 plotter  
 4 - CALCOMP 600 plotter  
 5 - CALCOMP 700 plotter

**RCBTRPEERROR** This bit controls the reporting of recovered magnetic errors. If not set the recovered errors are not reported to the user; if set then recovered errors are reported to the user by returning CCL and error number 39. Valid if the file is a magnetic tape file. This bit is adjusted by FSETHODE.

**RCBTBLOCK** This bit controls block node transfers on the 2644 page node terminal. This bit is adjusted by FCONTROL(28) and FCONTROL(29).

**RCBTLOG** This is the last I/O transmission log for the file. It comes from the I/O transmission log part of the IOCB returned by ATTACHIO. Not all ATTACHIO calls update this cell.

**RCBVORODR** This is the volume table index for the file. Applicable if the file is a disc file.

**RCBXMTCRLF** This bit controls CR and LF insertion into the user buffer on the 2644 page node terminal. This bit is adjusted by FCONTROL(30) and FCONTROL(31).

G.01.00  
 6- 33

If present, the PCB buffering extension contains from one to sixteen block buffers each having the following format:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
IDQ ENTRY INDEX																0 BLKIOQX
BLK LDEV NUMBER       U   R   O   I   N   P																1 BLKFLAG
IOCB - STATUS																2 BLKSTAT
IOCB - TRANSMISSION LOG																3 BLKLOG
BLOCK NUMBER																4 BLKBLOCK
																5
BLOCK SECTOR ADDRESS																6 BLKORADR
																7
BLOCK EXTENT BASE																8 BLKEKTBSE
																9
BLOCK EXTENT SIZE																10 BLKEXTSIZE
UNUSED																11
																12 BLKBUFFER
BUFFER																

Other identifiers used:

BLKFLAG = BLK(1)W, Flag and LDEV word  
 BLKLDEV = BLKFLAG.(0:8)W, block logical device number  
 BLKFLAG = BLKFLAG.(0:8)W, block I/O flags  
 BLKUNALLOEXT = BLKFLAG.(10:1), Block from unalloc. extent  
 BLKREVERSE = BLKFLAG.(11:1), FREERBACKWARD (not used)  
 BLKONTHWAIT = BLKFLAG.(12:1)W, I/O status not checked  
 BLKIOOUT = BLKFLAG.(13:1)W, last I/O was write?  
 BLKDIRTY = BLKFLAG.(14:1)W, buffer modified?  
 BLKIOPEND = BLKFLAG.(15:1)W, I/O in progress?  
 BLKIOCOMP = BLKFLAG.(14:2)W, I/O complete - not dirty  
 BLKIOCB = BLKOB(1)W, IOCB

G.01.00  
 6- 34

#### Discussion:

**BLKBLOCK** This is the block number of the data contained in the buffer. A value of -10 indicates that the buffer is empty.

**BLKBUFFER** This is the actual file system buffer space. Each buffer is exactly one file block in size.

**BLKORADR** This is the block's logical device and sector number.

**BLKDIRTY** This flag is set if the contents of the buffer has been modified. When the block buffer is re-used this flag is checked to see if the block needs to be written to the device.

**BLKONTHWAIT** This bit will be on if the I/O was already completed via "OONTWAIT" but the status has not been checked yet. Check the status before using the block in the buffer.

**BLKEXTBASE** This is the sector address of the extent base in which the block resides. This is used for disc caching.

**BLKEXTSIZE** The size, in sectors, of the extent in which the block resides. This is used for disc caching.

**BLKFLAGS** These are the miscellaneous flags associated with the block, which are described separately.

**BLKIOCB** This is the IOCB returned by the I/O system when the block I/O has completed. On a blocked I/O request this is obtained from the ATTACHIO call; on an unblocked I/O request this is obtained from WAITFORIO.

**BLKIOCOMP** This is the buffer modified flag (BLKDIRTY) and the I/O in progress flag (BLKIOPEND), which are described separately. This field is usually interrogated to see if it contains the value 2, which means that the buffer has been modified but not yet written to the device.

**BLKIOOUT** This is the mode of the I/O operation for the block. It is set by a write and cleared by a read.

**BLKIOPEND** This is the I/O in progress flag. It is set if the I/O is pending; it is cleared when the I/O has completed.

**BLKIOQX** This is the IOQ index of the unblocked I/O request for the block. It is used as the argument to WAITFORIO, which ensures the completion of the I/O request.

**BLKLDEV** This is the logical device number of the block. (Valid only for disc files.)

G.01.00  
 6- 35

**BLKSTAT** The I/O status part of the IOCB consists of the PCB number and the error code for the completed I/O request.

**BLKLOG** The transmission log part of the IOCB is the number of words or bytes transferred by the I/O request.

**BLKREVERSE** This bit would indicate that we are reading backwards from a tape. However, currently FREERBACKWARDS can only be performed unbuffered.

**BLKUNALLOEXT** This bit signifies that the block was "read" from an unallocated extent. Actually, the buffer was simply cleared with fill characters. Therefore, if a write is attempted to the block residing in this buffer, it must pass through FCONVBLK to allocate the extent first.

G.01.00  
 6- 36

File Control Block (Cont.)

There are two strategies to choose from in deciding where to place the FCB. If the file has been opened exclusive and no other processes could possibly share this file, then the FCB is placed into the `PXFILE` area (or in `NOBUF` expandable CBT if it won't fit in the `PXFILE` area or if the program is run with `NOCBF`). If the file could possibly be shared, then the FCB is always placed in a shared control block table. The number of a data segment containing a list of shared file system data segments is kept in system global location 1076 octal. The size of the FCB depends on the maximum number of extents specified at `FOPEN`; there are 44 (octal) words plus two per extent. There will be at least one extent, since the file label always exists in the first extent. The FCB extent map is in terms of logical devices and sector number. The extent map in the file label is in terms of volume rather than logical device; the map is converted by `VTOFLDEV` when the label is read, and converted back by `LDEVTOVTRB` when the label is written to disc.

## File System

FCBDEVICE	This specifies the device on which the files resides. If it is positive then it represents a logical device number; if negative it represents a (negative) device class index.
FCBDISP	This is the pending FCLOSE disposition for the file. Legal values are:  0 - no change 1 - save permanent 2 - save temporary and rewind 3 - saves temporary but do not rewind 4 - release 7 - invalid file (file label access error)
FCBCRUNCH	This bit governs if space will be returned beyond the EOF upon the last FCLOSE of the file.  0 - no change 1 - return space beyond EOF
FCBTYPE	This is the device type number of the first extent of the file. See FCBOTYPE for a list of legal values.
FCBEND	Block number of the file's EOF, relative to FCBSTART.
FCBEOF	This is the end-of-file pointer for this file. It is a double integer representing the number of records in the file. It can also be viewed as the record number of the next record past EOF.
FCBEXCLSTAT	This is the exclusive etatue of the file access. If -1 then the file is being accessed exclusively; otherwise it is the number of semi-exclusivs accessors.
FCBEXTMAP	This is the extent map of the file. The number of extents is specified by FCBNUMEXTS; a 0d extant descriptor indicates that the extent has not been allocated.
FCBEXTSIZE	This is the extent size, in sectors, of the file. All extents in the log except possibly the last have this size. This is a logical value, and legal values range from 1 to 65535 sectors. This restricts the maximum file size to 2097120 sectors (268,431,360 words).
FCBFLIM	This is the end-of-spaces pointer for the file. It is a double word integer representing the maximum number of records (fixed length record format) or blocks (un-defined or variable length record format) in the file.
FCBFDPTDINS	This is the FBPPTDINS in effect for the file.

FBSIZE	= FCB.(2:14)N,	size in words
FCBK1ST	= FCB(4).(0:2)W,	previous lock state
FCBTYPE	= FCB(4).(2:6)W,	device type
FCBCRUNCH	= FCB(4).(8:1)W,	pending crunch disposition
FCBCSUBT	= FCB(4).(12:3)W,	device subtype
FCBCINTOUT	= FCB(5).(0:8)W,	no. accesses - output
FCBCINT	= FCB(5).(8:8)W,	no. accesses
FCBCLASSFLG	= FCB(9).(0:1)W,	PV class flag
FCBMVTRBK	= FCB(9).(4:4)W,	Mounted volume table index
FCBMVRSX	= FCB(9).(8:8)W,	Volume Mask
FCBLLEOF	= FCB(16).(0:8)W,	no. labels written
FCBLR	= FCB(16).(8:8)W,	no. labels available
FCBLKFACT	= FCB(18).(0:8)W,	blockng factor
FCBSECTPBLK	= FCB(18).(8:8)W,	sectors per block
FCBSECTOFF	= FCB(19).(0:8)W,	sector offset to data
FCBDTSP	= FCB(19).(8:3)W,	pending disposition
FCBNUXTNS	= FCB(19).(11:5)W,	no. extents less 1
FCBNNEXTS	= FCB(21).(8:8)W,	no. accesses - input
FCBLABEL	= FCBDBL(18)W,	label LDEV and sector
FCBLDEV	= FCB(36).(0:8)W,	label LDEV

FCBACBOST	This is the OST of the FCB that was created at the same time as the FCB. This is used in conjunction with FCBMWFBCBOST when relocating the FCB.
FCBACBV	This is the vector table entry of the FCB that was created at the same time as the FCB. This is used in conjunction with FCBMWFBCBV when relocating the FCB.
FCBAH	This is the account name of the file. It is eight bytes in length with trailing blanks added.
FCBBLKFACT	This is the blocking factor of the file. It is the number of logical records in a physical block. Legal value range from 1 to 255.

G.01.00  
5- 40

**FCBGN** This is the group name of the file. It is eight bytes long with trailing blanks added.

**FCBLABEL** This is the logical device and sector number of the file label, which is the same as the first extent descriptor.

**FCBLASTEXTSIZE** This is the size, in sectors, of the last extent in the file. If the file has one extent then this is the same as **FCBEXTSIZE**; otherwise this value may be different from **FCBEXTSIZE**. This is the size of the last physical extent for the file; it is not the size of the last allocated extent.

**FCBLBL** This is the number of user labels allocated for the file. Since each label is a sector long, this is also the number of sectors allocated for user labels.

**FCBLBLEOF** This is the end-of-data pointer for the user labels. It is analogous to **FCBLEOF** in that it represents the number of labels written. The initial value is 0.

**FCBLDEV** This is the logical device number of the first extent of the file.

**FCBLKST** This is the previous lock state of the file and is derived from the file label. Legal values are:

- 0 - no accessors
- 1 - read
- 2 - write
- 3 - read/write

**FCBMVTABX** If the file resides on a private volume, then this field represents the mounted volume table index of the volume set entry on which the file resides.

**FCBNEWFCBST** This is the DST of the new FCB for the file. It is used in conjunction with **FCBFCBST** to move the FCB to a system (shared FCB) control block table when the second accessor is established. If this value is zero then there is no new FCB; if nonzero then a new FCB has been created.

**FCBNEWFCBV** This is the vector table entry of the new FCB for the file. It is used in conjunction with **FCBFCBV** to move the FCB to a system (shared FCB) control block table when the second accessor is established. If this value is zero then there is no new FCB; if nonzero then a new FCB has been created.

**FCBNUMEXTS** This is the maximum number of extents, less one, allowed for the file. It is not the number of extents

G.01.00  
6- 41

presently allocated, which is always determined by counting nonzero entries in the extent map.

**FCBNUMOPENCLSR** Number of open and close records in the message file.

**FCBOCNT** This is the number of accessors for the file. Alternatively it can be viewed as the number of PCBs created for the file.

**FCBOCNTIN** This is the number of file accessors having input access.

**FCBOCNTOUT** This is the number of file accessors having output access.

**FCBRIN** This is the RIN number used to support dynamic locking (i.e. **FLOCK** and **FUNLOCK**) for the file. If there is no dynamic locking then this number is zero.

**FCBSECTDFF** This is the sector offset from the file label to the first block of the file. This is not necessarily equal to **FCBLBL+1** since an integral number of blocks are allocated for the file and user labels.

**FCBSECTPBK** This is the number of sectors in a block for the file.

**FCBSIZE** This is the size, in words, of the complete FCB. It includes the extent map.

**FCBSTART** Block number of the file's start, excluding the file label block.

**FCBSUBTYPE** This is the device subtype number of the first extent.

**FCBUSERLBL** This field describes the user labels for the file. It consists of **FCBLBL** and **FCBLBLEOF**, described separately.

**FCBVMASK** If the file resides on a private volume set, this bit mask signifies which volume of the set in which the file resides. Bit 15 is on it resides on the first volume, bit 14 if on the second, etc.

G.01.00  
6- 42

File Label (FLAB)

The file label has the following format:

0	1	2	3	7	8	12	13	14	15

 FLVTRAB = FLAB(44).(0:8)%, label VTRAB index

## Discussion:

FLACCTNAME This is the account name of the file. It is eight bytes in length with trailing blanks added.

FLALLOCDATE Date that the file was allocated on this system.

FLALLOCTIME Doubleword containing the time that the file was allocated on this system.

FLBLKSIZE This is the block size, in sectors, of the file.

FLCHECKSUM This is the exclusive-OR checksum of the file label (excluding words 34, 42, and 43 octal) and is used for error detection. Each time the file label is read from disc the checksum is calculated and compared against the value recorded in the file label. Similarly, each time the file label is written to the disc the checksum is calculated and inserted into the file label.

FLCLID This is the cold load number in effect the last time that the file was accessed. This should always be the current cold load number. If it is not, it means that the system crashed while the file was open and that the data in the file label should be "reset" (principally the FCB vector FLFCBVECT).

FLCREATE This is the creation date of the file. It is in the format defined by the intrinsic CRENDAT.

G.01.00  
6- 46

## File System

FLDEVNAME This is the FOPEN device specification that was used when the file was created. This information is needed when new extents are allocated.

FLDTYPE This is the device type number of the first extent of the file; see ACBDTYPE for a list of legal values. This value is determined by configuration.

FLEND Number of current data blocks (that is, the end of file block number relative to the start of file).

FLEOF This is the end-of-file pointer for the file. It is a double word integer representing the number of records in the file. It can also be viewed as the record number of the next record past EOF.

FLEACL This is the exclusive access flag for the file. If set it means that the file has been opened exclusively by a single accessor. If not set then the file is potentially accessible by others.

FLEXTAB This is the extent map of the file. The number of extents is specified by FLNUMEXTS; a 00 extent descriptor indicates that the extent has not been allocated.

FLEXTSIZE This is the extent size, in sectors, of the file. All extents in the file, except the last, have this extent size. This is a logical value, and legal values range from 1 to 65535 sectors. This limits the maximum file size to 2097120 sectors.

FLFCBVECT If nonzero, this is the vector of the FCB for the file. If zero, the file is not being accessed.

FLFILECODE This is the file code of the file. Known values are:

## File System

1258	Pathflow STATIC File
1259	Pathflow DYNAMIC File
8000	Reserved for RPL
8099	
FLFLIM	This is the end-of-space pointer for the file. It is a double integer representing the maximum number of records (fixed length record format) or blocks (undefined or variable length record format) in the file.
FLFOPTIONS	This is the FOPTIONS of the file.
FLGAPNAME	This is the group name of the file. It is eight bytes long with trailing blanks added.
FLLABEL	This is the volume table index and sector number of the file label, which is the same as the first extent descriptor.
FLLASTACC	This is the last access date of the file. It is in the format defined by the intrinsic CALENDAR.
FLLASTMOD	This is the last modification date of the file. It is in the format defined by the intrinsic CALENDAR.
FLLASTEXTSIZE	This is the size, in sectors, of the last extent in the file. If the file has one extent, then this is the same as FLEXTSIZE; if the file has more than one extent, then this value may be different from FLEXTSIZE. This is the size of the last physical extent for the file; it is not the size of the last allocated extent.
FLLBL	This is the number of user labels allocated for the file. Since each label is a sector long, this is also the number of sectors allocated for user labels.
FLBLEOF	This is the end-of-data pointer for the user labels. It is analogous to FLEOF in that it represents the number of labels written.
FLLOEO	This is the LOEEO flag for the file. If set, it means that the file is a loaded program or SL file and cannot be modified except by a privileged accessor. This flag is set and cleared by the loader, not the file system.
FLLOCK	This identifies the word containing the lock bits, which are described separately.
FLLOCKWORD	This is the lock word of the file. It is eight bytes long with trailing blanks added. If it is all blanks, then the file does not have a lockword.

G.01.00  
6- 48

## File System

FLLOCNAME	This is the local name of the file. It is eight bytes long with trailing blanks added.
FLMOOTIME	Last time the file was modified.
FLNUMEXTS	This is the number of extents, less one, allowed for the file. It is not the number of extents allocated. Legal values range from 0 to 31, i. e., 1 to 32 extents.
FLNUMOPENCLSR	Number of open and close records in the message file.
FLPVINFO	File label private volume information. This is in the same format as the FCBPVINFO.
FLRECSIZE	This is the record size of the file in negative bytes.
FLRESTORE	This is the RESTORE flag for the file. If set, it means that the file is being RESTORED and cannot be accessed. RESTORE also sets the STORE bit for the file (FLSTORE); see FLSSR for a full description of the use of these bits. This flag is set and cleared by STORE/RESTORE, not the file system.
FLSECMX	This is the security matrix of the file. The bits are organized into five groups of six bits each. (Bits 0:2 are not used.) The groups correspond to the access types: READ, APPEND, WRITE, LOCK, and EXECUTE. Within each group, each bit specifies who may have the access: ANY, ACCOUNT MGR, ACCOUNT LTB- RARIAN, GROUP, GROUP LIBRARIAN, CREATOR.
FLSECTOFF	This is the sector offset from the file label to the first block of the file. This is not necessarily equal to FLLBL; since an integral number of blocks are allocated for the file and user labels.
FLSECURE	This is the file security enforcement flag for the file. If not set, then the file has been RELEASED and the security matrix FLSECMX should be ignored. If set, then secure as specified by the security matrix.
FLSSR	This is the STORE and RESTORE flags for the file, which are described separately. STORE and RESTORE decode the two-bit field to indicate their operation. Legal values are: <ul style="list-style-type: none"> <li>0 - file not in use by either STORE or RESTORE</li> <li>1 - illegal value</li> <li>2 - file being STORED</li> <li>3 - file being RESTORED</li> </ul> The file system interprets the leftmost bit as indicating that the file is being accessed by either STORE or RESTORE. The rightmost bit is interpreted as indicating what access should be permitted: 0 (file being STORED) allows read access; 1 (file being RESTORED) allows no

G.01.00  
6- 50

## File System

	access. This field is set and reset by STORE/RESTORE, not the file system.
FLSRL	This is the STORE, RESTORE and LOEEO flags for the file, which are described separately.
FLSRLX	This is the STORE, RESTORE, LOEEO and exclusive flags for the file, which are described separately.
FLSRELEASE	This flag is used by STORE/RESTORE. If a file is STORED with the "RELEASE" keyword, STORE will set this flag in the tape copy of the file label. RESTORE will allow any user to access such files, regardless of the file's normal security. If this bit is off in the tape copy of the file label, RESTORE applies normal security checks (as defined by the information in FLSECMX and FLSECURE). This bit is zero for files on disc.
FLSTART	Block number of the file's start, excluding the file label block.
FLSTATUS	This is the read/write status of the file. Legal values are: <ul style="list-style-type: none"> <li>0 - no accessors</li> <li>1 - read</li> <li>2 - write</li> <li>3 - read/write</li> </ul>
FLSTORE	This is the STORE/RESTORE flag for the file. If set it means that the file is being either STORED or RESTORED. The RESTORE bit (FLRESTORE) must be interrogated to determine which operation is taking place; see FLSSR for a full description of the use of these bits. This flag is set and cleared by STORE/RESTORE, not the file system.
FLSUBTYPE	This is the device subtype number of the first extent of the file. This value is determined by configuration.
FLUSERIO	This is the creating user name of the file. It is eight bytes long with trailing blanks added.
FLUSERLBL	This field describes the user labels of the file. It consists of FLLBL and FLLBLEOF, which are described separately.
FLVTRB	This is the volume table index of the first extent of the file.

G.01.00  
6- 51

## File System

File Multi-Access Vector Table (FMVAT) OSI(X54)

The FMVAT is used to locate shared PACB's for files opened multi-access. When an old disc file has been opened multi-access, the FMVAT is searched to determine if the file has previously been opened. The JIOTST and the DROOR found in the FMVAT are compared to the JIOTST of the job and the DROOR of the device or disc file being opened multi-access. If an entry exists for the file, then the PACB can be easily located for that file. If this is the first process opening the file, then an entry is created and inserted into the FMVAT for the file.

Spoolfiles are opened multi-access, therefore, they will have entries in the FMVAT. \$STOIN and \$STOLIST also have entries in the FMVAT since they too are opened multi-access.

Zero Entry Format

CURRENT TABLE SIZE	0 FM'CURR'SIZE

0	5

## Descriptions:

FM'CURR'SIZE The current size of the FMVAT in words. This value increases in increments of X200 words until FM'MAX'SIZE is reached.

FM'MAX'SIZE The maximum allowable size in words that the FM'CURR'SIZE can get. The current value of this is X4000. FM'MAX'SIZE can be changed only by changing the code in Initial. The open of the multi-access file is failed if this maximum is reached.

FM'ENTRY'SIZE Size in words of an FMVAT entry, 6 words at present.

G.01.00  
6- 52

## Typical Entry format

0	1	2	3	6	7	8	12	13	14	15
1	G	0	1							UNUSED
										JIT DST
										LOGICAL DEVICE
										DISK ADDRESS
										PACB VECTOR

FN'DEVICE = FNAV(0).(2:1)N, Device bit  
 FN'GLOBAL = FNAV(0).(1:1)N, Global multi-access bit  
 FN'LDEV = FN'DADOR(0).(0:8)N, Logical device number of file

## Descriptions:

FN'DADOR The disc address of the file label for disc files. For device files, the disc address is zero.  
 FN'DEVICE This bit is 1 for device files and 0 for disc files.  
 FN'LDEV Logical device number of device files or the LDEV of the disc containing the file label for disc files.  
 FN'JITDST The DST number of the JIT for the job that has the file open. If this field is nonzero, then only processes in the family tree of this particular job can open the file. This field is zero if the file was open global multi-access.  
 FN'GLOBAL This bit is 1 if the file was opened global multi-access, this allows multi-access to the file between jobs.  
 FN'PACBV The PACB vector for this multi-access file. Used to easily find the Physical Access Control Block for files opened multi-access.

G.01.00  
6- 53

## System Global Area (SYSGLOB)

The file system uses several words in the system global area for its own use.

SHFCBOST = SYSDB+X76, shared CBT DST no.  
 MONITOR = SYSDB+X77, monitoring flag word  
 MAXSSECT = SYSDB+X100, max # spoolfile sectors  
 NUNSSSECT = SYSDB+X102, current # spoolfile sectors  
 EXTSSSECT = SYSDB+X104, # sectors/spoolfile extent  
 SPOOLINDEX = SYSDB+X132, class spool index  
 CSIOWRITE = SYSDB+X135, CSIOWRITE LABEL  
 CCLOSEPLABL = SYSDB+X140, CS CCLOSE LABEL - FPROCTERN  
 DSCHEPLABL = SYSDB+X335, DSCHECK LABEL  
 DSOPEPLABL = SYSDB+X336, DSOPEL LABEL  
 DSCLOSEPLABL = SYSDB+X337, DSCLOSE LABEL  
 SDSLDEPLABL = SYSDB+X323, LABEL for SDSLDEV  
 MANMPLABL = SYSDB+X340, MANAGEWRITECDW LABEL  
 GLOBALAFTDST = SYSGLBEXT+X121 Global AFT DST number

## SIRs, Locks, and Deadlocks

The file system uses two SIRs: the file SIR, which is intended to protect file label integrity, and the FNAV SIR, which is to guarantee the integrity of the FNAV. Since the file system locks these resources and also locks control blocks, deadlocks can occur if locking is done in the wrong order. Not only must the file system handle locking correctly, but the entire ensemble of the file system, its callers, and its callees must do so also. These include KSAM, which has a SIR of its own, SYSUIMP, and STORE, which lock the file SIR because they tweak bits in file labels. The presently accepted order is:

Get FNAV SIR Lock ACB Get File SIR Lock FCB

It may not be necessary to do all of these things in any particular procedure. In modifying a procedure, you should be sure that any of these locks which you change are consistent not only within your own code, but also with its callers and callees.

G.01.00  
6- 54

## File System

## Shared CBT DST

In sysglobal X76 (ABSOLUTE X1076) there exists the shared Control Block Table DST number. This DST holds a list of shared CBT's. Shared CBT's are used to keep any and all file system control blocks that have the potential to be shared between processes. Any disc files opened shared will have its FCB kept in one of these CBT's. Also, all terminal PACB's will be stored in a system shared CBT so that an extra data segment is not wasted. This is possible because all terminal access is performed M08UF, which means that the PACB will be a minimal PACB and can be placed in these CBTs. Lastly, any file opened with global file access will have all its control blocks placed into these system CBT's.

The format of the system shared CBT DST is similar to a Control Block Table. It has the same words of overhead and the data (the list of DST's) starts in the next word after the overhead. The system CBT's are created one at a time as needed. Usually, there are only a few DST's in the list.

TABLE SIZE IN WORDS (X200)	0

PCB18	BPTLNK	BPTLINK
PCB19	PCB INDEX OF NEXT PCB ENTRY IN QUEUE	NQPTR
PCB20	PCB INDEX OF PREVIOUS PCB ENTRY IN QUEUE	PQPTR

PCB00 .(0:1) SAR ==> scheduling attention required  
 .(1:1) Bounds flag -- Privilege mode bounds check  
 .(2:1) CRIT ==> process is critical  
 .(3:1) HSIA ==> process has a sir  
 .(4:1) PTOVR ==> pending PI, proceee critical  
 .(5:1) HSPRI ==> hold sir priority  
 .(6:1) IPEXP ==> incore protect expired  
 .(7:1) PC ==> pre-empt capability  
 .(8:1) OSOFT ==> Delayed soft int processing. A pending soft int cannot be processed because of air or critical state. PSEUDOINT will be invoked when these condition(s) go away.  
 .(9:1) LW ==> long wait  
 .(10:1) SW ==> short wait  
 .(11:1) TRM ==> terminal read wait  
 .(12:1) USEDQ ==> used a quantum since transaction began  
 .(13:1) HIRPR ==> hold impeded priority  
 .(14:1) STOVR ==> processing abort due to stack overflow.  
 .(15:1) RITBK ==> Request Information Table Break

PCB01 .(0:16) SLLPTR, SLL relative index to process' segment locality list

PCB02 .(0:1) AOB, set if OB pointing to an absolute address  
 .(2:14) XDS, DST entry number of extra data segments to which OB is set; zero if none.

PCB03 .(0:1) STOVRALL FLAG ==> stack overflow is already allocated  
 .(1:2) SC, set if executing system code  
 .(2:14) DST entry number of process' stack

PCB04 .(0:1) M, mourning wait.  
 .(1:1) RG, global RIM wait.  
 .(2:1) RL, local RIM wait.

G.01.00  
7-5

.(3:1) MA, nail wait.  
 .(4:1) BID, blocked I/O wait.  
 .(5:1) IO, I/O wait.  
 .(6:1) UCP, UCOP wait and RIT wait.  
 .(7:1) JNK, junk wait.  
 .(8:1) TIN, timer wait.  
 .(9:1) MSG, file system basic IPC message wait.  
 .(10:1) SON, son wait.  
 .(11:1) FA, father wait.  
 .(12:1) IMP, proceee waiting to be unimpeded.  
 .(13:1) SIR, process waiting for a sir.  
 .(14:1) TIN, process waiting for a time out.  
 .(15:1) MEN, process waiting for memory.

PCB05 .(0:16) FPIH, father's PCB relative index  
 PCB06 .(0:16) SPIN, son's PCB relative index  
 PCB07 .(0:16) BPIN, brother's PCB relative index

PCB08 .(0:3) PSIN, pseudo - interrupt mode  
 1: hard kill  
 2: soft kill  
 3: etop  
 4: hibernate  
 5: escape  
 6: break  
 7: normal  
 .(3:1) RSOFI, OK for soft interrupt to wake process even though it is waiting on another event.  
 .(4:2) OR  
 0: other source  
 1: father  
 2: son  
 3: reply done on RIT wait  
 .(6:1) DEAD, set during expiration.  
 .(7:1) FAC, if set, the father is to be activated on process termination.

PCB09 .(0:1) LIVE, set if process is alive.  
 .(1:2) BMS, block nail, valid if MA set  
 0: sent to father  
 1: received from father  
 2: send to son  
 3: received son  
 .(3:2) PPC, process to process communication, set with respect to son.  
 0: null  
 1: son to father  
 2: father to son  
 3: blocked  
 .(5:1) STOV, stack overflow bit  
 .(6:3) PTYP, process type  
 0: user

G.01.00  
7-6

1: user, son of main  
 2: user, main  
 3: user, main, task  
 4: system  
 5:  
 6: system, UCOP  
 7:  
 .(9:1) SI, set when the Dispatcher (and PSEUDOINT) should be aware of a pending soft interrupt.  
 .(10:1) HK, hard kill pseudo interrupt  
 .(11:1) SK, soft kill pseudo interrupt  
 .(12:1) ST, stop pseudo interrupt  
 .(13:1) HB, hibernate pseudo interrupt  
 .(14:1) CY, control-y pseudo interrupt  
 .(15:1) BK, break pseudo interrupt

PCB10 .(0:15) EVENTFLGS, one for each wait class in PCB04  
 .(15:1) WS, wake up waiting switch set if an awake is missing.

PCB11 .(0:32) LASTREFSWAPSEG, segment identifier of last referenced swappable code segment.

PCB13 (QUEUEING INFO)  
 .(0:1) DISPC ==> on dispatching queue  
 .(1:1) L scheduling class  
 .(2:1) C scheduling class  
 .(3:1) D scheduling class  
 .(4:1) E scheduling class  
 .(5:1) INTER ==> process is interactive  
 .(6:1) COREA ==> process is core resident  
 .(7:1) RSOFI, Allow soft interrupt. A value of 1 implies that user soft interrupts will be processed. A zero value inhibits user soft ints (they are queued). This bit is managed by FINTSTATE and FINTEXIT intrinsics.  
 .(8:8) Process' scheduling priority

PCB14 .(0:16) PBX, CSTX block map index of process' program.

PCB15 .(0:16) NAPOST, DST entry number of the CST mapping table.

PCB16 .(0:16) PINPPIN, PCB relative index of previous impeded PIN.

PCB17 .(0:16) NINPPIN, PCB relative index of next impeded PIN.

PCB18 .(0:16) BPTLINK, breakpoint link for process

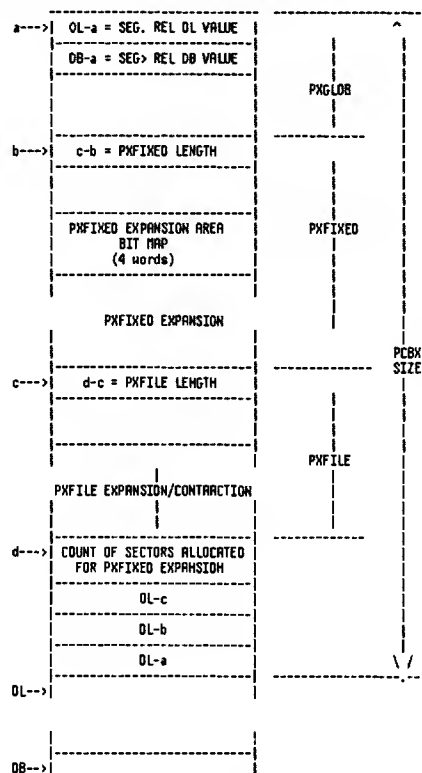

PCB19 .(0:16) NQPTR, PCB relative index of next proc in disp queue

PCB20 .(0:16) PQPTR, PCB relative index of prev proc in disp queue

DCY R DELAYED CONTROL Y IS PENDING (THIS BIT  
 IS CHECKED BY INIM ON BOUNDS VIOLATION TO  
 DETERMINE IF GOT: 1) TRUE BOUNDS VIOLATION  
 OR 2) AN INDUCED BOUNDS VID THAT INDICATES  
 THAT THE CONTROL Y TRAP PROCEDURE MAY NOW  
 BE ENTERED).

OSI STATE OF THE "ASOFT" PCB BIT WHEN CONTROL Y  
 TRAP WAS ENTERED. ASOFT = 1 ALLOWS USER SOFT  
 INTERRUPTS AGAINST THE PROCESS. IT IS SET TO  
 ZERO WHEN THE CONTROL Y HANDLER IS ENTERED.  
 IT IS SET TO ITS PRIOR STATE WHEN THE USER  
 CALLS RESETCONTROL.

\* SET TO COMMAND RECORD LENGTH WHEN COMMAND PENDING  
 (I.E. COMMAND ENTERED DURING BREAK OR ENCOUNTERED  
 DURING FLUSHING).

\*\* CONTINUE FLAG VALUES

0 = NO CONTINUE IN EFFECT  
 1 = CONTINUE JUST ENCOUNTERED  
 2 = CONTINUE IN EFFECT FOR THIS COMMAND

CY FLAG

PCBKFIXED(56).(1:1) = SET BY PSEUDOINT WHEN THERE IS R PENDING  
 CONTROL Y WHICH CANNOT BE PROCESSED BECAUSE  
 OF SYSTEM CODE OR PRIVILEGED CODE. INIM  
 CHECKS THIS BIT ON BOUNDS VIOLATION OR  
 TRACE TRAP.

SI FLAG

PCBKFIXED(56).(3:1) = SPECIFIES THE STATE OF THE USER INTERRUPT  
 FLAG WHEN THE CURRENT CONTROL Y WAS PROCESSED.

G.01.00  
 7- 13

#### PKFIXED Expansion Bitmap

The PKFIXED bitmap and expansion area is for use in accounting  
 of extra data segments acquired by the process.

#### File System Section of PCBK (PKFILE)

The PKFILE area is a subsection of the PCBK. It is a contiguous, expandable  
 and contractible block of storage that is managed by the file system  
 primarily for its own use. Other subsystems, namely CS and DS, also make  
 use of the PKFILE section. In doing so they must conform to the  
 conventions of the File system.

The overall structure of the PKFILE area is:

G.01.00  
 7- 14

#### Overhead

The part labeled Overhead contains information that pertains to the  
 entire section. It is addressed via the pointer at DL-3.

D	1	7	8	15
PKFILE SIZE IN WORDS				
LAST DOPEN ERROR NO.   LAST COPEN ERROR NO.				
N				
LAST DS AFT				
SLAVE AFT NUMBER				
LAST XOPEN ERROR NUMBER   LAST FOPEN ERROR NUMBER				
AFT SIZE IN WORDS				
CS TRACE FILE INFO				
LAST RESPONDING NO-WRIT I/O AFT ENTRY NUMBER				
1ST USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				
2ND USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				
3RD USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				
4TH USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				
5TH USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				
6TH USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				
7TH USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				
8TH USER (NOBUF) CONTROL BLOCK TABLE DST NUMBER				

Partial word Field identifiers are:

PKFOOPEN = PKFILE(1).(0:8)N, last DOPEN error code  
 PKFCOPEN = PKFILE(1).(8:8)N, last COPEN error code  
 PKFNOCB = PKFILE(2).(0:1)N, no CB's in PKFILE CBT?  
 PKFKOPEN = PKFILE(5).(0:8)N, last KOPEN error code  
 PKFFOPEN = PKFILE(5).(8:8)N, last FOPEN error code

G.01.00  
 7- 15

#### Discussion:

PKAFTSIZE This is the size (in words) of the Active File Table (AFT).  
 The size is in words to simplify calculating the size of  
 the available block.

PKFCBT1-8 These are the DST numbers of the user (NOBUF) control block  
 tables. R DST number of 0 indicates that no data segment is  
 allocated.

PKFCOPEN This contains the last COPEN error number. Not used by the  
 file system.

PKFCTRINF0 This contains information pertinent to the CS trace file.  
 Not used by the file system.

PKFDDOPEN This contains the last DOPEN error number. Not used by the  
 file system.

PKFDSINF0 Reserved for DS. Not used by the file system.

PKFFDOPEN This contains the last FOPEN error number. If it is zero  
 then the last FOPEN successfully completed; otherwise the  
 last FOPEN was unsuccessful and the number is the file sys-  
 tem error number.

PKFXOPEN This contains the last KOPEN error number. KSAM is partly  
 embedded in the file system, and an FOPEN Failure on a KSAM  
 file can be caused by a Failure to open either the key files  
 or the data file. This error number is used in conjunction  
 with PKFFDOPEN to determine which file caused the KSAM open  
 failure. This error number is not used by the file system.

PKFLEFTOFF This is the AFT entry number of the last File/line that  
 completed a nowait I/O; if zero then no nowait I/O has been  
 completed. This cell is maintained solely by and for the  
 IDWRIT intrinsic.

PKFNOCB This bit signifies that control blocks are not to be  
 created in the PKFILE control block table. This bit is set  
 by the NOCB parameter to the CREATE intrinsic or the :RUN  
 command. This feature permits the user to have as much  
 stack space as possible; otherwise the file system will  
 take several hundred words of stack for the PKFILE control  
 block table.

PKFSIZE This is the size (in words) of the complete PKFILE area. It  
 is the sum of the overhead block, the control block table,  
 the active file table and the available block.

G.01.00  
 7- 16

PKFILE Control Block Table (PKFCBT)

Addressing within a PKFILE control block table is somewhat more complicated than addressing an extra data segment CBT since the table does not begin at DB+0. As a result all pointers within the table are table relative; the starting address of the table must be added to a pointer to generate a final DB-relative address. This addressing convention is consistently applied to all control block tables.

When the control block table is expanded, space is taken from the AVAILABLE area. If no space is available then the PKFILE area is expanded and the acquired space is added to the AVAILABLE area.

Available Block

The part labeled Available is used to provide space when the Control Block Table or the Active File Table is expanded. These two tables grow towards each other, and when more space is needed it is simply taken from the Available Block.

When the Available area is exhausted, the PKFILE area is expanded, the AFT is relocated and the new space is added to the Available Block.

Currently the PKFILE area is only expanded; it is never contracted. For more information refer Chapter 6 beginning with Active File Table page 6-7.

G.01.00  
7- 17

PCBX For Core Resident System Process Stacks

NOTES: 1. There is no PKFILE area.  
2. The PKFIXED area is much smaller than a normal PCBX.

G.01.00  
7- 18

Process To Process Communication Table

This table is used as the communication link by which father and son processes communicate with one another via the mailbox scheme. This table contains two words per entry and is indexed by PCB# (entry index 0 is meaningless). Each two word entry of index N essentially relates where, as well as how much, mail may be found for a process N with respect to communications between N and his father process.

ENTRY FORMAT

word 0	WORD COUNT
word 1	MAIL WORD OR DST#

where word 0 = the # of mail words to be transferred.  
word 1 = the only word of mail itself if word 0 = 1  
otherwise  
it contains the DST# of the extra data segment where "word count" words of mail exist.

NOTE: Assume process S is the son of process F. Then the process to process communication table index which will be used for mailbox communication between son S and Father F will be that of the son (i.e. S).

FORTRAN Logical Unit Table (FLUT)

The assembler is responsible for the preparation and initialization of a FORTRAN logical unit table. This is done when a program is prepared if that program contains at least one program unit that references a logical unit. The location of the FLUT is in the secondary DB area and the address of this location is contained in DB-1.

The FLUT is formatted as per the following example:

DB-1	X
------	---

DB+X	3	0
	4	0
	5	0
	7	0
	10	0
	255	///

1st BYTE	2nd BYTE
List of the logical unit numbers referred to in this FORTRAN-produced program. (255 terminates).	The MPE file number (as returned by FOPEN) used in accessing the file. Zero if file not open. Filled in by formatter as each l.u. is initially referenced.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

## CHAPTER 8 JOB TABLES

## Job Tables Overview

**Job Master Table (JMRT):** One entry per job/session. Contains information needed to get the job/session running. Entry is created at the introduction of job/session.

Job Information Table (JIT): One DST per job/session. Contains information needed by the job/session as it is executing.

Process Job Cross Reference Table (PJXREF): One DST per system.  
Used to determine the job/session main process (command interpreter)  
for any process on the system.

Job Process Count Table (JPCNT): One entry per job/session. Entry number used to index into the JIR to lock job resources.

**Job Directory Table (JDT):** One DST per job/session. Contains the following sub-tables used by descendants of job/session. Must obtain JIR (by using JPCNT index) before accessing JDT. Sub-tables:

1. Data Segment Directory - Directory of sharable DSTs used by job/session
2. Temporary File Directory
3. File Equation Table
4. Line Equation Table
5. Job Control Word Table

Job Cut-off Table (JCUT): Stores total CPU time limit of job/session and accumulates the CPU time that job/session uses.

Ucop Request Queue: A queue of Process Identification Numbers that are terminating.

## JMAT (Cont.)

36	JMAT CREATOR PIN	30	Used with the programmatic creation of sessions.
37	P U N	31	P=Programmatic logon U=URITILLON N=NOWAIT
40	Reserved	32	
41	Reserved	33	
42	Reserved	34	
43	Reserved	35	
44	Unused	36	
45	Unused	37	

O1:2:3|4:5:6|7:8:9|0:1:2|3:4:5  
1 1 1 1 1

R = RESTART  
N = SEQUENCEO  
S = ORIGIN is spooled.

FT = funny terminal  
00 - regular term.  
01 - regular term,  
special logon  
10 - RPL term.  
11 - RPL term.

G.01.00  
8- 5

## Job States

JOB STATES - JMAT ENTRY WORD 0.(0:6)

SHOWJOB - Displays job states by scanning JMAT OST (X31)

LOGON USES ALL STATES EXCEPT "SUSPEND"

STATE NO.	STATE NAME	PROCESS	SEGMENT	PROCEDURE(S)
1	INTRO	DEVREC JSMP SPOOLER	MURSERY	STARTDEVICE ->PUTJMAT ->ALLOCCENTRY IN SEGMENT ALLOCCUTIL
X70	SCHEO	UCOP	JOBSCHEO	CXSTSTREAM SCHEDULESCHED
X40	WAIT	DEVREC JSMP SPOOLER	MURSERY SPOOLING	STARTDEVICE ->SCHEDULEJOB SPOOLSTUFFIN ->SCHEDULEJOB
X60	INIT- IALIZATION	UCOP	UCOP	LAUNCHJOB
2	EXEC	JSMP	MURSERY	INITJSMP
3	TERMIN- ATING	JSMP	MORQUE	TERMINATE ->EXPIRE -> CLEANUPJOB
0	FREE ENTRY	JSMP	MORQUE	TERMINATE ->EXPIRE -> CLEANUPJOB ->DERLOCCENTRY IN ALLOCCUTIL
4	SUSP	JSMP	OPLow	CXBRKJOB

For states INTRO and WAIT,

DEVREC => logon command originated on terminal or  
other unspooled device.  
SPOOLER => logon command originated on spooled device.  
JSMP => logon command is the result of the execution of  
a :STREAM command. (This also includes USER  
processes which have done programmatic :STREAMs.)

G.01.00  
8- 6

## Process Job Cross Reference Table (PJXREF)

DST = X62

TABLESIZE = NPCB entries + 1

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	NUMBER OF ENTRIES														
1	J/S NUMBER OF PIN 1														
2	J/S NUMBER OF PIN 2														
n	J/S NUMBER OF PIN n														
n+1	J/S NUMBER OF PIN n+1														

This table is only used by the SHOW command. The entries in the table are set up through PROCARETE and modified by MORGUE.

The job/session number is in the format:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

00 = Unused/undefined  
01 = Session  
10 = Job  
11 = Unused/undefined  
Bit 2-15 = Job/session Number

A completely zero entry is either from a system process or a currently unused pin.

G.01.00  
8- 7

## Job Process Count Table (JP CNT)

(1 Bit Entry/Running Job )

MEMORY RESIDENT

SYSGLOBAL BASE = 0B+13(X15)  
OST = 24(10)  
SIR = 13(10)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	Total Configured number of Jobs and Sessions														
1	Total number of free entries														
2	Bit Map relative index of word containing next free entry														
3	unused														
4	Bit Map														
	Maximum 64 words long														

free entry = 1  
allocated entry = 0

A JP CNT entry must be allocated before the main process can be precreated. The JP CNT Index is located in word 4, PXGLOBAL area, of the stack of a job or session. One JP CNT Index is allocated per job or session.

The job SIR (JIR) = base+JP CNT index, where base is the number of system reserved SIRs. The JIR is used to lock the Job Directory Table.

NOTE: This table is completely bit oriented with each entry consisting of one bit. Entries are taken from available pool on a "first found" basis. A "1" found in the bit map indicates a free entry. A zero (0) found in the bit map indicates an allocated entry. Word 2 of this table is the index of the word in the Bit Map where the next free entry resides. At system start up, this word is set to zero (0). The Bit Map can be thought of as ranging from 0-63 (64 total words - 1024 entries).

G.01.00  
8- 8

Job Cutoff Table (JCUT)  
1 Entry/ CPU-limited Job

MEMORY RESIDENT

```

SYSGLOB BASE = DB+11(Z13)
DST = 36(10);SIA = 14(10)
SYSGLOB + Z117 = default
CPU time limit for jobs

```

0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15

\* THE FORMAT FOR UCAP (X46-47) IS AS FOLLOWS:

[illegible]

G.01.00  
8- 12

Allow Mask Format

\*\* The Allow mask for MPE V is expanded to six words. There is a mask in each user's JIT and the global allow mask in the SYSGLB extension area. The Allow mask contains enough bits for a one-to-one correspondence to every present OPERATOR type command, or any future OPERATOR command. When a user is ALLOWed any OPERATOR command or ASSOCIATED to a device (which will use OPERATOR type commands) then the corresponding bit(s) in the mask in that user's JIT for that command is set. If the ALLOW or ASSOCIATE was done on a global scale, then the bit(s) in the mask of the SYSGLB area is/are updated.

The following EQUATES define the mask bit for each operator command.

The first set of commands define the operator commands dealing with devices.

When adding a new command to this set of EQUATES, be sure to add a corresponding new statement in LOGIMAGE, even if the command will not be logged.

	Word	Bit	#

G.01.00  
8- 15

Job TablesJob Data Segment Directory Entry (In JDT)

If a DST is allocated as sharable, then it will have entries in both the JDT and PMFIN. Sharable means that it can be shared by all processes in the Command Interpreter process tree (sons, etc.). Nonsharable DSTs only have entries in the PMFINED.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
SEGMENT 10															
EXTRA DATA SEGMENT DST INDEX															
# OF PROCESSES ACCESSING															

NOTE: A return of X2004 in the INDEX value after using the GETDSEG intrinsic indicates that there is no more room in the Job Directory Table for another job sharable data segment.

Job Temporary file Entry (In JDT)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
ENTRY SIZE (WORDS)   NAME SIZE (WORDS)															
NAME-ACTUAL FILE DESIGNATOR															
VOLUME POINTER															
FILE LABEL POINTER															

Since all son processes of a CI share the same JDT, exclusive access of the JDT is controlled with the Job SIA (JIR) and is locked and unlocked by calls to LOCKJIR and UNLOCKJIR. The JIR number is found in the PKGLOB area (JPCOUNT index). Only job and sessions traces have JIRs, system processes do not, even though they have JDTs. The JDTs were provided for system processes for consistency, but are not meant to be increased or reduced.

UCOP Request Queue (DSTW9)

The UCOP Request Queue (URQ) is used to signal UCOP that a process is requesting process deletion. The URQ is a circular queue using a FIFO algorithm to process requests. When the next available pointer is equal to the next request pointer, then the table is empty. When the next available pointer is (logically) one less than the next request pointer and the request is entered, then the table is full. A full table will cause System Failure 1 (SF1). Thus, the last (logical) entry cannot be used. An entry is added via a call to REQUCOP.

The UCOP Request Queue (RPE IV) was previously used for many functions such as stack expansion, but those functions moved to other areas with RPE V. The only valid entry now is a type 2 entry (process deletion). The original format is retained in the event that more functions are added.

G.01.00  
8- 22

UCOP Entry Format

Each entry is  
2 words long

G.01.00  
8- 23

## CHAPTER 9 RELOCATABLE OBJECT CODE

## USL Files Introduction

- \* USL record length 128 words always.
- \* Layout of doubleword disc addresses

- \* Hash links join all entries with the same hash key regardless of type.
- \* Linear lists terminate with a zero link
- \* Circular lists containing only the list head point directly to themselves.
- \* Single-word disc addresses

Uninitialized fields are reserved for future use and should be set to zero.

## Record 0 and Overall USL File Format

BYTE	1/2	3
REAL	2	4
DOUBLE	2	5
LONG	3	6
COMPLEX	4	7
LABEL (SPL)		10
CHARACTER (STRING)	N/2	11
LABEL (FORTRAN)		12
UNIVERSAL (MATCHES ANY TYPE)		13

## STRUCTURE

SIMPLE VARIABLE	0
POINTER	1
ARRAY	2
PROCEDURE	3

## MODE

NULL	0
VALUE	1
REFERENCE	2
NAME	3

NOTE: R descriptor of 0 results in an automatic match.

## Pascal

Pascal sets the high order bit in the parameter type descriptor when it is generating hashed values. The remaining 15 bits are based on a hash of the types of the parameter. Only the Pascal compiler can compute the value, and the SEGMENTER must match the whole 16 bit value.

G.01.00  
9- 5

## Entry Type 0

## GARBAGE

0	1		10	11	15
		NW		0	
GARBAGE

Clarification Notes on Entry Types 2 and 4  
With Respect to SPL and FORTRAN

ENTRY TYPE 2 SPL D.B.	ENTRY TYPE 4 SPL PROC	ENTRY TYPE 2 FORTRAN MAIN	ENTRY TYPE 4 FORTRAN SUB.
TPDB	0	0	0
1,5	1	1,2,3,4	1,2,3,4
TSDB	TSDB	TSDB	TSDB
NWPUST	NWPUST	NWPUST	NWPUST
5			
NWSD	NWSD	NWSD	NWSD

WHERE: TPDB = Total primary DB length in words  
TSDB = Total secondary DB length in words  
NWPUST = Number of words in "TRACE" array  
NWSD = Number of words in secondary DB array  
NWSD = Number of words in own array  
NWSD = Number of words in data array

Notes: 1. Does not include the length of the STLT  
2. Does not include the length of the FLUT  
3. Does not include the length of any common array  
4. Includes the length of any DB-allocated format array  
5. Are not necessarily equal

In general TPDB and TSDB are summations of storage allocated in the global area of the program's data segment. They are not, however, complete since the compilers are not aware of all storage actually allocated. The STLT and FLUT are examples of this since these tables are constructed by the segmenter. Common arrays also present a problem since their inclusion in TPDB and TSDB might cause their storage requirements to be counted more than once.

TH - PROCEDURE TYPE

G.01.00  
9- 20

Entry Header Format

EACH ENTRY (EXCEPT SECONDARY ENTRY POINT ENTRIES) MAY DESCRIBE N> 0 SETS OF HEADERS. THE HEADERS IN EACH SET MUST BE CONTINUOUS AND IN THE SAME ORDER AS THE HOW LIST DESCRIBING THE SET.

THE CODE MODULE MAY BE PLACED IN ANY POSITION IN A HEADER SET. NOTE THAT IF THE CODE MODULE IS AT THE BEGINNING OF A SET, SAC = SAH.

IF THE ENTRY HAS NO HEADER SET, THEN NH, SAN SEQUENCE IS ABSENT.

G.01.00  
9- 21

Header Type 0

GARBAGE

Header Type 1

PCRLs

PBR - PB' ADDRESS OF LINKED LIST OF PCRL INSTRUCTIONS TO BE REPAIR-LOWER 14 BITS USED AS NEGATIVE DISP. - BIT 0 SET MEANS THAT THE WORD IS NOT A PCRL INSTRUCTION, BUT A POINTER TO A SST LABEL OF "EXTERNAL" FORMAT - A LINK OF 0 TERMINATES THE LIST - BIT 1 SET MEANS THAT THE WORD IS TO BE INITIALIZED WITH THE PB ADDRESS OF THE PROCEDURE.

G.01.00  
9- 22

Header Type 2

PB ADDRESSES

PBR - PB' ADDRESS OF PB ADDRESS TO BE CORRECTED

Header Type 3

OWN/DATA VARIABLES

PBR - PB' ADDRESS OF OWN VARIABLE POINTER TO BE CORRECTED

G.01.00  
9- 23

Header Type 4

OSDB/OWN/DATA/VALUES

LD - LOGICAL WORD DISPLACEMENT IN OWN ARRAY FOR INITIAL VALUES  
B - BYTE BIT-SET IMPLIES THAT LD IS TYPE BYTE AND THAT THE FIRST WORD OF THE INITIAL VALUE BLOCK IS A COUNT OF THE NUMBER OF BYTES IN THE INITIAL VALUE BLOCK  
IN - INTEGRATION NUMBER - NUMBER OF TIMES THE BLOCK OF INITIAL VALUE IS TO APPEAR IN THE SECONDARY BD - 1->NO DUPLICATION, 2->DUPLICATION, ETC

Header Type 5

PUST

PBR - PB' ADDRESS OF LINKED LIST OF POINTERS TO BE INITIALIZED WITH OS ADDRESS OF PUST (SAME LIST FORMAT AS FOR FORMAT STRINGS) A PBR of -1 INDICATES NO FIX-UPS.

G.01.00  
9- 24

NOTE: ALL REFERENCES TO THE PUST INCLUDE THE FOUR-WORD HEADER THAT IS APPENDED BY THE SEGMENTER. THESE WORDS ARE NOT PRESENT IN THE HEADER; THEY ARE AUTOMATICALLY ALLOCATED AND INITIALIZED BY THE SEGMENTER.

Header Type 6

RL File Format

NOTE: UNINITIALIZED FIELDS ARE  
 RESERVED FOR FUTURE USE AND  
 SHOULD BE ZERO.

G.01.00  
 9- 30

## Relocatable Object Code

Storage Management

FILE SPACE IS MANAGED IN TERMS OF 32 WORDS BLOCKS (4 BLOCKS PER 128 WORD RECORD).

FREE SPACE (BLOCKS) IS ACCOUNTED FOR IN A BIT MAP, WHICH IS PARTITIONED INTO RECORDS (2K BLOCKS PER SECTION). A 0 INDICATES THAT A BLOCK IS USED, A 1 INDICATES THAT IT IS FREE.

FILE SPACE IS ALSO PARTITIONED INTO 512 RECORD SECTIONS (64 MAX. SECTIONS, 2K BLOCKS PER SECTION, 1 MAP PER SECTION). THE NUMBER OF SECTIONS IN A FILE IS NS=(FL+511) & LSR(9). THE FIRST NS RECORDS FOLLOWING RECORD 0 (RECORDS 1 TO NS) ARE RESERVED FOR THE SECTION MAPS.

A COMPLETE FILE ADDRESS WOULD HAVE THE FOLLOWING CONFIGURATION:

FILE (WORD) ADDRESS  
 DOUBLE WORD

G.01.00  
 9- 31

## Relocatable Object Code

Entry Point Directory

THE DIRECTORY IS PARTITIONED INTO 95 HASH LISTS (SAME HASH FUNCTION AS USL); EACH HASH LIST IS A LINKED LIST OF RECORDS.

EACH RECORD CONTAINS A SUCCESSOR LINK (RECORD N) AND A USED SPACE COUNT. A LINK OF 0 TERMINATES A LIST. WHEN A RECORD IS VOID OF ENTRIES (USED=2), ITS SPACE IS RETURNED TO THE FREE STORAGE AREA.

G.01.00  
 9- 32

I	T	K													
I	T	K													

T - PATCH AREA EXISTED IN ALL CODE SEGMENTS  
 K - CHECKSUM VALID

## CST Remapping Array

CONTAINS THE LAST CST NUMBERS ASSIGNED TO THE SEGMENTS; INDEXED BY SEGMENT NUMBER. WHEN A PROGRAM FILE IS PREPARED, THE ARRAY IS INITIALIZED TO 0, 1, ..., N. THIS ARRAY IS USED TO RE-ESTABLISH INTRA-PROGRAM LINKAGE WHEN THE PROGRAM IS LOADED.

## Segment Descriptor Array

CONTAINS THE SEGMENT LENGTH AND A FLAG INDICATING IF THE SEGMENT IS TO BE LOADED IN PRIV. MODE. INDEXED BY SEGMENT NUMBER. ALL SEGMENTS BEGIN ON A RECORD BOUNDARY. THE NUMBER OF RECORDS FOR A GIVEN SEGMENT IS (SL + 127) & LSA(7). THE RECORD NUMBER, SAS, OF SEGMENT N IS

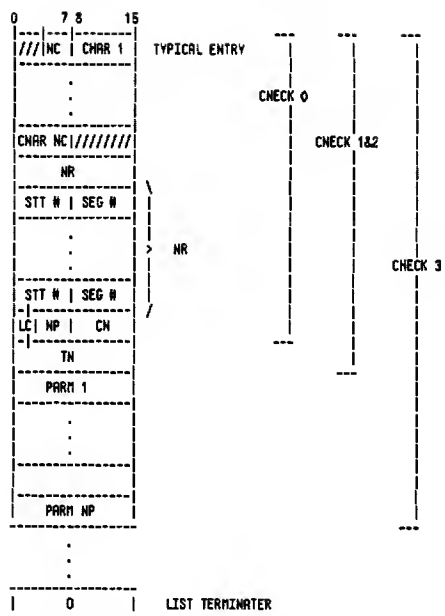

SAS:=0  
 FOR I=0 TO N-1  
 BEGIN  
 SAS:=(SAS + (SL(I) + 127)&LSA(7))  
 END

## Global Area Format

A SET OF RECORDS CONTAINING THE INITIAL VALUES FOR THE GLOBAL AREA OF THE DATA SEGMENT. THIS SET BEGINS AT RECORD SAG (WORD 3) AND CONSISTS OF (GS + 127) & LSA(7) RECORDS.

G.01.00  
10- 4

## Storage Management

FILE SPACE IS MANAGED IN TERMS OF 128 WORD BLOCKS (1 BLOCK PER 128 WORD RECORD).

FREE SPACE (BLOCKS) IS ACCOUNTED FOR IN A BIT MAP, WHICH IS PARTITIONED INTO RECORDS (2K BLOCKS PER SECTION). A 0 INDICATES THAT A BLOCK IS USED; A 1 INDICATES THAT IT IS FREE.

FILE SPACE IS ALSO PARTITIONED INTO 2048 RECORD SECTIONS (16 MAX. SECTIONS, 2K BLOCKS PER SECTION 1 MAP PER SECTION). THE NUMBER OF SECTIONS IN A FILE IS  $NS=(FL+2047)/LSR(7)$ . THE FIRST NS RECORDS FOLLOWING RECORDS 0, 1 (RECORDS 2 TO NS+1) ARE RESERVED FOR THE SECTION MAPS.

IF THE SECTION MAPS SPECIFY MORE SPACE THAN IS POTENTIALLY AVAILABLE, THOSE RECORDS BEYOND FLIMIT ARE MARKED AS "USED".

### Entry Point Directory

THE DIRECTORY IS PARTITIONED INTO 95 HASH LISTS (SAME HASH FUNCTION AS USL); EACH HASH LIST IS A LINKED LIST OF RECORDS.

EACH RECORD CONTAINS A SUCCESSOR LINK (RECORD #) AND A USED SPACE COUNT. A LINK OF 0 TERMINATES A LIST. WHEN A RECORD IS VOID OF ENTRIES (USED=2), ITS SPACE IS RETURNED TO THE FREE STORAGE AREA.

THE HASH LIST HEAD POINTERS (HL IN THE DIAGRAM ABOVE) ARE IN RECORD 0 WORDS X41 TO X177.

G.01.00

U - Uncallable bit - set if entry point is uncallable.

Prepared Object Code

### Code Segment Linkage Structure

EACH CODE SEGMENT OCCURIES AN INTEGRAL NUMBER OF RECORDS. THIS BLOCK OF INFORMATION CAN BE SUBDIVIDED INTO THREE TABLES: THE CODE SEGMENT PROPER, AN STT SEGMENT MAP ARRAY, AND AN EXTERNAL LIST.

## STT MRP ARRAY

A 1 BYTE X 256 BYTE ARRAY. IT IS INDEXED BY STT NUMBER AND RETURNS (IF THE STT CORRESPONDS TO AN INTERNAL OF THE SEGMENT) THE SEGMENT NUMBER OF THE EXTERNAL AND 255 OTHERWISE. THIS ARRAY IS USED WHENEVER THE SEGMENT IS LOADED AND IS UPDATED WHENEVER THE SL IS BOUND BY THE SEGMENTER.

**INTERNAL LIST**

A SYMBOLIC LIST OF THE EXTERNALS OF THE SEGMENT. EACH ENTRY CONTAINS INFORMATION ABOUT THE EXTERNAL: PARAMETER CHECKING LEVEL AND PARAMETER MATCHING INFORMATION, AND THE SEGMENT NUMBER AND STT NUMBER IF THE EXTERNAL IS SATISFIED WITHIN THE SL.

G.01.00

INTERNAL LIST TERMINATOR

G.01.00  
10- 16

Reference Table Structure

FOR EACH SEGMENT THERE IS A REFERENCE TABLE ENTRY OF 32 WORDS. THE REFERENCE TABLE ENTRIES ARE PACKED FOUR TO A RECORD. THE RECORDS CONTAINING THE REFERENCE TABLE ENTRIES ARE LISTED IN RECORD 1. THE RECORD CONTAINING THE REFERENCE TABLE ENTRY N IS REC 1 (N.(0 : 14)); THE FIRST WORD OF THE ENTRY IS REFTAB (N.(14 : 2) & LSL (5)).

WHEN A SEGMENT IS DELETED, THE REFERENCE TABLE ENTRY CORRESPONDING TO THE SEGMENT IS RELEASED. THESE FREE ENTRIES ARE LINKED TOGETHER IN A LIST; THE SEGMENT # IS USED AS A LINK AND IS PLACED IN THE FIRST WORD OF THE ENTRY.

WHEN A SEGMENT IS ADDED IT IS ASSIGNED A SEGMENT NUMBER (0 LESS THAN/EQUAL TO N LESS THAN/EQUAL TO 254); THE NUMBER IS THAT OF THE FIRST FREE REFERENCE TABLE ENTRY, OR, IF NONE ARE FREE, THE NEXT AVAILABLE REFERENCE TABLE ENTRY (CAUSING SPACE ALLOCATION FOR THE ENTRY).

## XLST Overview

```

DB |-----|
   | PRIMARY DB AREA
DB+7 --> |-----|
      SBUF (128 words)
DB+0 --> |-----|
          DIRECTORY
Z  |

```

The above DST's has exactly the same primary DB area so that directory entry handling procedures can be used on both DST's. XLST is the LST extension and is used to store the extension entry only. When an extension entry is needed, it is copied into the LST to eliminate frequent EXCHANGE DB. Note that XLST is capable for any types of entries. It is used for extension entry only for now. Also, some of the primary DB's in the XLST are not used. They are there just for the consistency.

## Logical Segment Transform Table (LSTT)

When a process references any user SL segments, these segments are assigned logical segment numbers if the new mapping code is running. The LSTT provides a map mapping these logical segments into their physical segment numbers and having true STT's for the mapped segments. The LSTT is created by LOADER during the load time. It occupies an DSF and the DSF number is stored in PCB(15). If no user SL segment is referenced, the LSTT will not be needed, hence it will not be created.

The new mapping microcode depends on the existence of the LSTT for getting the physical segment number for a mapped segment. So the LSTT has to be included in process' locality list if there is an LSTT. Dispatcher will then bring the LSTT in before the process can be run. Also the bank and address for the LSTT belonging to the current running process are stored in sysglob cells ( X221 and X222 ) during the launch time by the dispatcher. These cells are used by microcode for fast accessing the LSTT.

G.01.00  
11- 14

## Serial Disc Tables and Data Structures

The primary purpose of the Serial Disc Interface (SDISC) is to adapt the undefined length transfers characteristic of magnetic tape to the fixed-length environment of a disc or cartridge tape (CTAPE). To accomplish this, data is buffered within SDISC. The buffer is an integral number of sectors (blocks for the CTAPE) long. Files always start on a sector boundary, but data records within files may start anywhere and straddle sector boundaries. A record in the buffer is structured as follows:

record length (bytes)	data	record length (bytes)
-----------------------------	------	-----------------------------

The record length is always a one-word positive byte count which includes only the data portion of the record, not the length words themselves. Records within a file might be stored on the disc as follows:

The reason for the trailing byte count is to implement an easy way to backspace records.

available

G.01.00  
12-8

End of File Format

Since files always start on a sector boundary, it follows that they also end on one. End of files consist of a 0 record length and 0-fill to the end of the current sector as follows:

In addition, an End-of-File entry is made in the Gap Table, so that files may be skipped by scanning Gap Table entries instead of serially scanning the data area. The Gap Table is described a few pages from now.

G.01.00  
12- 9

Contiguous Block Format

A serial disc, if it can do everything a magnetic tape can do, must also be a cold-load device. This means that machine microcode must be able to read a bootstrap channel program and the resident segments of INITRL from the disc into memory. The microcode and channel programs cannot deal with the record length words which surround standard data records, so for them we have a structure, called a CONTIGUOUS BLOCK, which has the data without the length words. Information as to the length of each contiguous block must therefore be kept elsewhere, so there are Gap Table entries which hold the beginning and ending sector addresses of each contiguous block. This implies that each block must begin and end on a sector boundary. In this way they are similar to data files. To set contiguous blocks off from normal data, and to reach a sector boundary, a record length and fill character = X177777 is used, as follows:

Hole Format

Holes on the serial disc have the same format as contiguous blocks (that is, they start and end on sector boundaries with -1 fill characters as required). Starting with MPE version G.00.00, holes are obsolete and SDISC will not generate them. However, code has been left in SDISC to process any holes found on serial discs written with earlier versions of SDISC. Further details may be found in the Serial Disc IMS.

G.01.00  
12- 10

Gap Table Format

The Gap Table is a four-word header followed by a series of two-word device address entries. A permanent copy lives on the device, starting in sector 4, while a working copy lives in main memory. The copy in memory is posted to the disc only when a backspace or rewind operation occurs after writing (in other words, when the copy in main memory has changed). The length of the Gap Table is device-dependent according to the table below:

Device	Number of sectors (or CARTRIDGE blocks)
HP7920	44
HP7925	106
HP7933/35	219 (250 for G.00.00 and later releases.)
HP7902/8895	26
HP9110/HP9144	4 blocks ("S" cartridge)
HP9110/HP9144	15 blocks ("L" cartridge)

The Gap Table looks like this:

The type field is bits 0, 1 and 2 of the first word. The eight possible types are:

0. End of File. The associated sector address contains one or more end of file fill characters (0) to fill out that sector. In the worst case (the previous record ended exactly at the end of the previous sector), the end of file sector contains all zeros.
1. End of data. The associated sector address is the last address of valid data plus 1, in other words, the next available address. In practice, such an entry is usually preceded by an end-of-file entry, since the EOD entry is written when you stop writing, and the file system will not let you backspace or rewind after writing without sending a Write End of File. An EOD entry is also written at the beginning of the Gap Table when new (unwritten) media is inserted. This prevents erroneous reading of blank media.

G.01.00  
12- 11

2. Beginning of Hole. The starting address of a "defective" area of the disc. Usually on a track boundary, but may be in mid-track if a contiguous block was being written when the "defect" was encountered. Obsolete, starting with MPE version G.00.00.
3. End of Hole. The corresponding ending address of the "defective" area. Always at a track boundary. Obsolete, starting with MPE version G.00.00.
4. Beginning of (contiguous) Block. The starting address of a contiguous block, exclusive of the -1 fill characters which may have been required to get us to a sector boundary. Unlike the End of File fill characters, there need not be any -1 characters if the previous record or contiguous block (with or without the trailing length word) ended exactly on a sector boundary.
5. End of (contiguous) Block. The address of the last sector containing contiguous block data. The sector may also contain -1 fill characters to get us to a sector boundary, but as with the beginning of block they are not required if the contiguous block ends exactly on a sector boundary.
6. End of Tape mark. The sector address of the simulated End of Tape reflector. This type is now written only to floppy discs for use by INITRL's serial disc interface. When read by MPE's SOISC, it will be skipped no matter what device it is found on. This ensures compatibility with older serial discs.
7. End of Gap Table. No associated sector address. If you hit this while scanning the Gap Table, you've gone too far. In practice, this type is created whenever the Gap Table is cleared, by the simple device of initializing the table to -1.

G.01.00  
12- 12

SDISC Extra Data Segments

With insignificant exceptions, SDISC operates entirely in split-stack mode, that is, using an extra data segment for its working storage. Starting with MPE version 6.00.00, there are two additional data segments used as no-wait data buffers. For the most part, our discussion here is restricted to the original data segment, now used only for variables, the Gap Table, and data buffer management.

The working storage extra data segment (XDS) is usually acquired by the external procedure ALLOCATE when the serial disc device is first assigned to a user as part of an FOPEN. The external procedure DEALLOCATE makes the XDS go away as part of its processing of the final FCLOSE against the device. The system program PVPROC may also acquire and release an XDS so that the tape label routines in LABSEG may also use SDISC for their work when DEVREC processes a device on-line interrupt. SDISC allocates the two data buffer segments as they are needed, then deallocates them as part of the Device Close processing.

In addition to the Gap Table already described, the XDS contains SDISC's global storage area, including the data buffer management areas (BUFFER'INFD), and a small buffer (called WORKTABLE). WORKTABLE holds the contents of the Serial Disc label sector when SDISC reads it in as part of its self-configuration. It also holds the Defective Tracks Table (MAC family discs) or Defective Sector Table (CS80 discs) while reassigning suspect or deleted tracks.

The three arrays in the XDS (WORKTABLE, BUFFER'INFD and GPT (Gap Table)) are all dynamically configured by SDISC as vanilla indirect arrays, such as might have been constructed by SPL. This is done by declaring the array names as pointers, then inserting appropriately computed element-0 addresses in them.

The extra data segment is organized as follows:

0	WORDSPECTRA	These twelve words are reserved for use by ALLOCATE when the data segment is created. However, ALLOCATE only stuffs the last five of them. We fill the first seven ourselves with information we get from the label sector.
1	SECTORSPECTRA	
2	STARTADDRESS (BDT)	
3	EDTSECTA (disc address of simulated end of tape)	
4	EDDSECTA (last sector of disc)	Simulates tape runoff.
5	JUSTALLOCATED	Tells us to initialize SDISC parameters to BDT if true.
6	WRITE RING	Simulation of tape write ring.
7	FATALEHORA	Disables SDISC permanently when true.

6.01.00

## CHAPTER 13 I/O

### I/O Table Linkage

G.D1.00  
13- 1

## Device Reference Table (DRT)

SIOP - absolute address of SIO program  
 PI - interrupt handler label  
 DBI - this is the absolute address of the ILT

G.D1.00  
13- 2

### Driver Linkage Table (DLT)

	D	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0																
1	QUEUE NUMBER								DFNCR   CRI				ID INTP			
	(SEE BELOW)															
2	MONITOR LABEL															
3	INITIATOR LABEL															
4	COMPLETOR LABEL															
5	INTERRUPT LABEL															
6	DIT SIZE								DEVICE TYPE							
7	CS DRIVER EDITOR LABEL															
8	INITIALIZATION LABEL															

There is one DIT for each type of driver. A pointer in the DIT allows different devices on a controller to have different drivers and interrupt handlers.

```

DPRDC.QNUMB - This field contains the I/O process request queue
              number for type 2 drivers. Zero for all other types.
.(8:1).DRVRFZLN - Driver code frozen. Set by MAN when then the driver
  (OF)           code segment has been made present and frozen from a
              request from STODN.
.(9:1).MNRERRORC - MAN Error on Code Makepresent
  (NC)
.(10:1).CORERES - If set both initiator and completor code are core
  (CR)           resident.
.(14:2).DRVRTYPE - DRIVER/MONITOR TYPE
  (RTVP)
              0 - not used
              1 - driver can be executed on any stack
              2 - driver can be executed in the user process or
                  in the I/O process identified by IDNUMB
              3 - run only in process whose PCB number is in
                  IDNUMB

```

DMNTR - I/O Monitor Plabel.

DTNIT - Driver Initiator Procedure Label.

DCOMP - Driver Completor Procedure Label.

DINTP - Special interrupt handler label. This procedure is called by GIP if ISPEC is set DFLAG. No other action is taken by GIP except to set the Interrupt Status in DSTRY.

DTYPE.DITSIZE - The length of the DIT in words for this driver.

G.01.00  
13- 3

Logical-To-Physical Device Table (LPDT)

```
DST = 13 (= X15)
SIR = 9  (= X11)
```

The LPDT has several fields which describe the state of a device. Some of these fields have the same meaning for all devices. Others are device dependent. All are described below.

There are two types of devices represented in the LPDT: real devices and virtual devices. A real device is one which has been configured into the system and is capable of performing input and/or output. A virtual device simulates some of the properties of a real device (for example a spooled line printer or an IMP), but there is no physical I/O involved. The two main uses for virtual devices are for OPEN spooled devicefiles and certain communication devices (such as IMP's).

R given virtual device entry is in use only while the devicefile it represents is open. When the file is FCLOSED, the entry becomes available for another virtual device. This is the reason for the SYSOUMP/INITIAL configurator question MRX # OF OPEN SPOOLFILES--it needs to know how many virtual device entries to allocate to the LPDT (and to the IOT).

Entries in the LPDT are ordered by logical device number. The first word address of a real device entry is obtained by multiplying the LDN by the entry size. Except for the 0th entry, entries for which no logical device is configured on a given system are used for virtual device entries. Any remaining virtual device entries follow the last real device entry.

G.01.00  
13-4

Entry 0

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Number of entries in table															
Entry size = 4															
DEVREC service request count															

Discussion:

Word 2 is incremented by a device driver whenever it sets the Device Ownership State field (below) to 2 (Service Requested). DEVREC decrements the count for each interrupt it services until the count reaches 0, at which time DEVREC hibernates.

-- CAUTION --

Device drivers must lock this table by DIS-ABLE/ENABLEing, -NOT- by trying to acquire the LPDT SIR.

Typical Entry (Virtual Devices)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Pointer to XDD subentry															

ID -- 0 for input, 1 for output.

Word 0, bit 0 is 1 for a virtual device, 0 for a real device. The fields in word 1 are the same, as applicable, as for the real device represented by a given virtual device. See below.

G.01.00  
13- 5

Typical Entry (All Real Devices)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
SYSDB-relative pointer to the DIT															

Discussion:

Word 1.(0:2) -- Device Ownership State:

- 0 -- Not owned by any process.
- 1 -- Owned by a process.
- 2 -- Service requested. Set by driver for unexpected interrupt, then wakes DEVREC.
- 3 -- Service granted. Set by DEVREC. Logon sequence is 0-2-3-1.
- 3 -- Device reserved (alternate use). Set during STARTSPool, spooler process sets to 1 when it gets started.

Word 1.(2:1) -- Device is Job/Session Accepting if true.

Word 1.(3:1) -- Device is Data Accepting if true.

Word 1.(5:1) -- Device is Duplicative if true (all devices except discs).

Word 1.(6:1) -- Device is Interactive if true (all devices except discs).

Word 1.(7:3) -- End of file condition:

- 0 -- No EOF detected.
- 1 -- Hardware EOF (e.g., tape mark).
- 2 -- :DATA record read.
- 3 -- :EOD record read.
- 4 -- :HELLO record read.
- 5 -- :BYE record read.
- 6 -- :JOB record read.
- 7 -- :EOL record read.

Word 1.(12:4) -- Device subtype. See discussion for tape entry (below) for a description of the Auto bit (12:1).

The remaining bits in Word 1 are device-dependent and are described with their corresponding entry diagram.

G.01.00  
13- 6

Entry for Terminal-Like Devices

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
SYSDB-relative pointer to the DIT															

Discussion (unique fields only):

Word 1.(4:1) -- CONTROL-Y is allowed and has been detected.

Word 1.(10:1) -- BREAK has been detected --OR- ignore BREAK if the C.I. is running.

Word 1.(11:1) -- The terminal is logging on. This bit is set by PROGEN and DEVREC when the logon sequence starts. If the bit is off when polled by INITJSP, the terminal has disconnected. For now, only IOTERM and HIDTERM support the use of this bit. Multipoint and DS pseudo-terminals do not.

Entry for Tape Drives

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
SYSDB-relative pointer to the DIT															

Discussion (unique fields only):

Word 1.(4:1) -- BDT. Tape is at Load Point --OR- no tape mounted. Recording density may only be switched when this bit is true (for multiple density tape drives).

Word 1.(11:1) -- If true, DEVREC is performing Automatic Volume Recognition (AVR) on a tape (or PVPRDC is doing the same on a serial disc). --OR- AVR is to be suppressed on job or data accepting devices.

G.01.00  
13- 7

Word 1.(12:1) -- Part of Device Subtype field. If true, device may be allocated automatically when opened. If false, operator must allocate.

Word 3.(2:1) -- AUTO REPLY. Device may be allocated without prompting the operator for REPLY. This bit is set automatically if word 1 (12:1) is true.

Entry for Disc Drives

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
SYSDB-relative pointer to the DIT															

Discussion (unique fields only):

Word 1.(0:2) -- Device Ownership State. May not be 1 (owned) for shared device (system volume or private volume). Serial and foreign discs are non-sharable and may be owned. See the full discussion of this field under Typical Entry, above.

Word 1.(4:1) -- If true, the disc is a non-system domain (private volume, serial disc or foreign disc) disc drive.

Word 1.(5:1) -- If true, disc is a mounted private volume.

Word 1.(6:1) -- If true, the disc is a reserved volume used to satisfy the requirements of a multiple volume private volume set.

Word 1.(10:1) -- If true, the disc is a physically and logically mounted serial or foreign disc. Bits 5 and 6 must be false.

Word 1.(11:1) -- If bit 10 is true, then 1 ==> foreign disc, 0 ==> serial disc.

Word 3.(1:1) -- If true, the device is currently being used as a serial disc (that is, it is allocated to a user as a serial disc). This bit duplicates a bit in the LDTX entry so that this information can be found in a system (memory-resident) table.

Word 3.(2:1) -- AUTO REPLY. Device may be allocated without prompting the operator for REPLY. This bit is set automatically if word 1 (12:1) is true.

G.01.00  
13- 8

### Typical Entry Format

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
File use count															
Volume table index if device type = 0-7, else main process pin # or spooler process pin #															
Record width					CS FOI					Device type					
Spool Sy Di Dn Tr Hd CIS					Device-dependent  state tag Rq Rr as Q  info (see below)										
////////										XDD head index					
CDNTRL-Y pin															
Default output device -DR- default class index (see discussion)															

**Discussion:**

```

Word 2.(9:1) -- Communication system device if set.
Word 2.(9:1) -- If set, there are special forms mounted on the device.
Word 3.(0:2) -- Spooled state of the device:
    0 -- Not spooled.
    1 -- Owned by an input spooler.
    2 -- Owned by an output spooler.
Word 3.(2:1) -- Device is available to system (not down).
Word 3.(3:1) -- Device is available to diagnostics (obs).
Word 3.(4:1) -- :DOWN requested, honored when use count = 0.
Word 3.(5:1) -- If set, trailers are disabled.
Word 3.(6:1) -- If set, headers are disabled. These two bits are
    managed such that header/trailers are generated in
    pairs or not at all.
Word 3.(7:1) -- If I/O, word 6 is the Device Class Table
    index/LDEV# of the default output class/device
    associated with this device.
Word 3.(8:1) -- Spooling has been enabled (spool queues are
    open) for this device.
Word 3.(9:7) -- Device dependent information:
    1. For terminal-like devices, the default
        terminal type to be used if not specified
        in the :HELL command.
    2. For variable density tape drives:
Word 3.(10:3) -- actual tape density.
Word 3.(13:3) -- density requested in FOPEN for writes to
    unlabelled tapes only.
    For either:
    0 = unknown density/no FOPEN w/ write.
    1 = 1600 BPI
    2 = 6250 BPI
    3 = 800 BPI

```

### Overview of Data Segment

The diagram illustrates the structure of the Logical Device Table (LDT) and its extension (LDTX). It is divided into two main sections by a dashed horizontal line. The top section is labeled "Logical Device Table (LDT)" and the bottom section is labeled "Logical Device Table Extension (LDTX)". Above the LDT section, there are two labels: "DST 14 (= X16)" on the left and "DST X16" on the right, connected by a dashed line. Above the LDTX section, there is a label "DST 10 (= X12)" on the left, connected by a dashed line. The entire structure is enclosed in a dashed rectangular border.

G.01.00  
13- 11

G.01.00  
13- 12

of entries in the class) and indicates the LDEV# in the class list on which the last extent was allocated. The disc space allocation routines will try to satisfy the next request on the next disc drive indicated by the cyclical pointer (with wraparound to 1 if the pointer > N). If that fails, the pointer is incremented until space is found or all devices in the class have been tried.

Word 4.( 8:1) --If set, spooling has been enabled (spool queues opened) for this device class.

Word 4.( 9:1) --If set, the class is a terminal type class.

Word 4.(10:6) --Usually the same as the device type represented by the class (0-7 for disc, 24 for tape, 32 for printer, etc.). Serial disc classes are disc devices accessed as tape drives, so their true device types are kept in the LDT, while this field holds a special type (31, or X37), indicating a serial I/O (non-concurrent) device. Similarly, a foreign disc is a nonsharable disc drive, so that fact is reflected by a special type 7 in this field, even though the true hardware type is kept in the LDT, as for serial discs.

G.01.00  
13- 17

#### Terminal Descriptor Table Typical Entry Format

The Terminal Descriptor Table contains a varying number of variable length entries, because each Terminal Descriptor entry may have an arbitrary number of logical devices. However, you can only configure a fixed number of valid terminal entry files. These are the T1nn or TTPCLnn files which reside in PUB.SYS.

G.01.00  
13- 18

	Seekmask (Disc only)														
	I/O Program Area														

G.01.00  
13- 19

#### ILT (Cont.)

IPCVR - These four words comprise the channel program variable area where information is stored concerning a channel program Interrupt instruction or abort. CPVRO should be used only for channel program aborts.

ICPVR4 - Words 4 and 5 contain DMA address, when channel program aborts during DMA transfer.

ISRQL - Serial poll request queue length. NP-18 Systems do not support any serial poll devices. This should always be zero.

ICPGM - This is the SYSDB relative address of the channel program to be started for this device after receiving a NIOP interrupt in GIP. GIP will call STRRTIO when the flags word indicates "ignore halt interrupt" and "start channel program" bits are set.

ICNTRL - Contains controller information.

.N If set, the controller is sharing a software channel resource in order to limit bandwidth.

.CHNO The software channel resource number.

.DRTN The DRT number for a Series 33 device is equivalent to:  
.CHRN - channel number (4 most significant bits of DRTN)  
.DEV - device number (3 least significant bits of DRTN)

IFLAG - Used for controller flags.

.RW Runwait flag. Rn idle channel program should be started when there are no active requests to process.

.WP Waitprog flag. Rn idle channel program has been started for this controller. This bit is reset by an interrupt.

.IG Ignorehi flag. Rn NIOP instruction has been issued against this controller, but the channel program was not in a wait statement. Therefore, ignore the interrupt generated by the channel code when this program halts.

.SC Start channel program flag. When set along with the IG flag, GIP will start a previously attempted SIOP on this device.

.SQ Start channel program "queued" flag. When bit SC is set, this bit will determine if the call to STARTNP18 will have logical parameter QUEUED true or false.

.HCUNIT Highest configured unit number for this controller.

G.01.00  
13- 20

Device Information Table (DIT)

There is one DIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the I/O queue element. Although details of DIT's vary with device, the following structure is common to all:

DIT for MP-IB Systems

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	T	D	AC	RQ	SI	HU	0	IO	IR	NO	ST	MS	STATE		DFLAG
1	SYSDB relative pointer to the DIT for the next device requesting this resource or service														
2	SYSDB relative pointer to the first IOQ in request list for this device														
3	Logical device number														
4	SYSDB relative pointer to Device Linkage Table														
5	SYSDB relative pointer to Interrupt Linkage Table														
6	Controller Hardware Status														
7	Hardware error status. Set when the driver detects an error. Whenever <0, the driver monitor logs an I/D error and clears this word														
8	Device Dependent Area														
9	Device Dependent Area														
10	IOT //////////////// Phys. unit #														

DTRQX Used by some device drivers, it denotes timer request index.

G.01.00  
13- 21

DIT Terminology for MP-IB Systems

DFLAG - DEVICE RELATIVE FLAGS  
 T SET IF DEVICE IS A TERMINAL.  
 D SET IF DEVICE IS A DISC.  
 AC ACTIVE BIT. 1 IMPLIES A MONITOR CURRENTLY SERVICING THIS DEVICE.  
 RQ REQUEST BIT. 1 IMPLIES SERVICE REQUESTED WHILE MONITOR IS ACTIVE.  
 HU IF SET, MULTIPLE UNIT CONTROLLER.  
 IO IF SET, THEN A CHANNEL PROGRAM IS CURRENTLY EXECUTING.  
 IR IF SET, AN INTERRUPT OR RESPONSE HAS OCCURRED.  
 NO IF SET, DEVICE IS IN A NOT READY OR OPERATOR WAIT.  
 ST IF SET, AN IDLE CHANNEL PROGRAM SHOULD BE STARTED FOR THIS DEVICE.  
 SI SPECIAL INTERRUPT HANDLER  
 NS DO NOT SHORT WAIT THIS DISC.  
 STATE CURRENT DRIVER STATE AS DEFINED BY THE MONITOR.  
 ALLOWABLE STATES ARE:  
 0 - START REQUEST  
 1 - NOT USED (BUT RESERVED)  
 2 - CALL DRIVER INITIATOR  
 3 - CALL DRIVER COMPLETOR  
 4 - NOT USED (BUT RESERVED)  
 5 - COMPLETE REQUEST  
 6 - UNEXPECTED INTERRUPT OCCURRED  
 7 - START OPERATOR INTERVENTION WAIT  
 X10 - WAITING (ON OPERATOR). RESTART AT 0  
 X11 - WAITING (DATA MAKEPRESENT/FREEZING)  
 X12 - WAITING (INITIATOR CODE MAKEPRESENT/FREEZE)  
 X13 - WAITING (FOR COMPLETION INTERRUPT)  
 X14 - WAITING (FOR DEVICE CONTROLLER AVAILABILITY)  
 X15 - NOT USED (BUT RESERVED)  
 X16 - WAITING (INITIATOR CODE MAKEPRESENT)  
 X17 - WAITING (COMPLETOR CODE MAKEPRESENT)  
 IOT - I/O System type 0-Series II/III I/O System  
 1-MP-IB Systems  
 2-unused  
 3-unused

Device Information Table (DIT) for CIPEA

There is one DIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the IOQ element (however, this driver only supports one device per controller.) The following diagram shows the DIT used for the MP-IB CIPEA physical driver.

G.01.00  
13- 22

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	PHENONIC									
0		0		0		0		0		0		0		0		STATE	DFLAG									
1	SYSDB relative pointer to the DIT for the next device requesting this resource or service																OLINK									
2	IOQ table index to the first IOQ in request list for this device																DIQOP									
3	TOT		Phys. unit #				Logical device number										DLDEV									
4	SYSDB relative pointer to Device Linkage Table																ODLTP									
5	SYSDB relative pointer to Intrp Linkage Table																DIILT									
6		VS		AB		RE		TP		NR		MR		CNT	DEVICE STATUS		DSAVE									
7	Hardware error status. Set when the driver detects an error. Whenever <0, the driver monitor logs an I/O error and clears this word																DSEAR									
X10	Bit 0 is set at completion of timer																OTIME

DFLAG - flags and request state

AC ACTIVE - A monitor is currently servicing this device.  
 RQ REQUEST - A service request is pending while the monitor is active.  
 HU - An I/D Channel Program is running for this device.  
 IO - An interrupt or response has occurred for this device.  
 IR - Go to state X10 after Idle Channel Program is started.  
 NO NOTRDY - The device monitor is starting an Idle Channel Program for this device. There is no IOQ associated with this type of request.  
 ST STWAIT - State of the device monitor. Specifies the next action to be taken in SIDON in servicing the request:  
 0 - start new request  
 1 - not used  
 2 - call driver initiator procedure  
 3 - call driver completer procedure  
 4 - not used  
 5 - process request completed  
 6 - initiate device recognition sequence  
 7 - start operator intervention wait

G.01.00  
13- 23

X10 - wait for interrupt (operator intervention) restart at state 0  
 X11 - wait for data segment freeze, then state 2  
 X12 - wait for driver initiator to be frozen, then allocate controller (state 2)  
 X13 - wait for I/D completion interrupt, then state 3  
 X14 - wait for controller, then call driver initiator  
 X15 - not used  
 X16 - wait for initiator naks present, then state 2  
 X17 - wait for completer nake present, then state 3

DLDEV - I/O system type, unit and logical device number

0 - NP3000 Series III/III  
 1 - NP 3000 NP-IB  
 2 - Unused  
 3 - Unused

DSAVE - Device processing flags

VS - VALID STATUS - Set to indicate Device Status has been updated.  
 AB - DVARFLAG - Sequence Abort in progress due to ABORT request.  
 RE - RETRYFLAG - Sequence Abort in progress due to an error.  
 TP - TIMERPOPPED - Current error is due to software timer popping.  
 NR - NOTRDYFLAG - Not Ready Wait in progress.  
 NR CNT - Number of Not Ready Waits during this request.  
 DEVICE STATUS - Device status returned during a Sequence Abort.  
 BIT 8 - CRC available and enabled.  
 " 9 - Reserved.  
 " 10 - Reserved.  
 " 11 - Reserved.  
 " 12 - Power fail or reset has occurred.  
 " 13 - A protocol error has been detected.  
 " 14 - A parity error has been detected.  
 " 15 - The peripheral has data to send.

DSERR - Pointer to status to be logged.

Bits(0:8) - Number of words to be logged.  
 Bits(8:8) - Offset relative to DITP(0).

DCOUNTS

- Error flags and error counts (4).  
 RF - RED FAILED - An error has forced this request to be aborted.  
 UE - UNIT ERROR - The current error is a Unit Error.  
 DE - DATA ERROR - The current error is a Data Error.  
 TD - TIME OUT - The current error is a GIC Time Out Error.  
 UNIT CNT - Number of Unit Errors during this request.  
 DATA CNT - Number of Data Errors during this request.  
 TD CNT - Number of GIC Time Outs during this request.  
 PRTY CNT - Number of NP-IB Parity Errors during this request.

G.01.00  
13- 24

## DIT for Channel Devices

0	TERM	DISC	ACT	RED	M	SID	ID	IAK	M	INT	STATE	D	FLAG		
					UNIT	PREMP	PRDG	HEADIRY							
1															
2															
3															
4															
5															
6															
7															
8															
9															
10															

## DRIVER DEPENDENT DIT AREA

DFLAG.terminal - Device is a terminal  
 .disc - Device is a Disc (Bit 0 = 0)  
 .active - R monitor is currently servicing this device  
 .request - Service requested while monitor was active  
 .munit - device controller servicing multiple units  
 .siopreempt - If set then a request has been queued for this device. Preempt code is set in IDQ.  
 .idprdg - I/O program in progress. Decrement SIDCOUNT and check for multi-channel when complete  
 .iak - Interrupt or Response has occurred.  
 .m head - Moving head disc  
 .nt rdy - Not ready for SID. SIDOM holds off next SID until ALLDWPDL is done.  
 DTRQX - Used by some device drivers, it denotes timer request index.

G.01.00  
 13- 25

## DIT for Channel Devices (Cont.)

DFLAG.STATE - this quantity specifies the next action to be taken in servicing the request.

- 0-new - start request.
- 1-not used.
- 2-call Driver Initiator Procedure
- 3-call Driver Completer Procedure
- 5-complete request
- 6-device recognition
- 7-start operator intervention wait (X10)
- X10-restart request on interrupt
- X11-wait for data to be frozen then state 2
- X12-wait for driver code to be frozen then state 2
- X13-call completer on interrupt
- X14-wait for device controller
- X15-not used
- X16-wait for initiator nake present then state 2
- X17-wait for completer nake present then state 3

DLINK - SYSDB relative pointer to the DIT for the next device requesting this resource or service.  
 DIDQP - SYSDB relative pointer to the first IDQ in the request list for this device  
 DLOEV.LDEVN - Logical Device Number  
 .UNIT - unit number of the physical device.  
 .IDT - ID type 0=> Series III I/O, 1=> NP18 I/O  
 DDLTP - SYSDB relative pointer to the DLT.  
 DILT - SYSDB relative pointer to the ILT.  
 DSTAT - interrupt status for this device. Set each time the device interrupts.  
 DSERR - Hardware Device Controller Status. Set when the driver detects an error. Whenever not zero, SIDDB logs an I/O error and clears this word.  
 DTIME - time out completed flags. If a timeout occurs in response to a timer request type X20 (I/O request), the sign bit is set in this word. The IAK bit in DFLAG is also set, and the monitor for this device is awakened. (Only used if timer services are requested. Must be word #8 if timer services are requested.)

G.01.00  
 13- 26

13- 30

X34	RE	DC	DR	EN	LOCAL STATE										RPSWORD1
X35	T1										T2	RPSWORD2			

DFLAG - flags and request state

TM TERM - Set if device is a terminal.  
 DS DISC - If TM = 0 and this bit is set then the device is a disc, otherwise device dependent.  
 RC ACTIVE - R monitor is currently servicing this device.  
 RQ REQUEST - R service request is pending while the monitor is active.  
 ID IDPRDG - Rn I/O Channel Program is running for this device.  
 IR IAK - Rn interrupt or response has occurred for this device.  
 NO NOTRDY - Go to state X10 after Idle Channel Program is started.  
 ST STHAIT - The device monitor is starting an Idle Channel Program for this device. There is no IDQ associated with this type of request.  
 STATE - State of the device monitor. Specifies the next action to be taken in SIODM in servicing the request:

- 0 - start new request
- 1 - not used
- 2 - call driver initiator procedure
- 3 - call driver completor procedure
- 4 - not used
- 5 - process request completed
- 6 - initiate device recognition sequence
- 7 - start operator intervention wait
- X10 - wait for interrupt (operator intervention) restart at state 0
- X11 - wait for data segment freeze, then state 2
- X12 - wait for driver initiator to be frozen, then allocate controller (state 2)
- X13 - wait for I/O completion interrupt, then state 3
- X14 - wait for controller, then call driver initiator
- X15 - not used
- X16 - wait for initiator wake present, then state 2
- X17 - wait for completor wake present, then state 3

DLINK - A SYSDB relative pointer to the next DIT requesting this resource or service.

DCURREQ - P current request sysbase index.

DUNIT.(0:2) - I/O system type

- 0 - non-HP-IB
- 1 - HP3000 HP-IB Systems
- 2 - Unused
- 3 - Unused

G.01.00  
13- 31

DLDEV - Logical device number of this device.

DSTRT - Set to a -1 when a system powerfail has occurred.

DSERR - Pointer to status to be logged.

Bits(0:7) - Number of words to be logged.  
 Bits(8:15) - Offset relative to DITP(0).

DMISC - Device dependent processing flags

LOCK\*FLG - Lock flag denoting unload status of the disc volume.

- 0 - Allow operator unload to the volume.
- 1 - Deny operator unload to the volume.

IGNORE\*INT\*FLG - Ignore unexpected interrupt flag.

SUBSTRATE - Indicates state of the idle channel program:

- 0 - Normal idle channel program wait
- 1 - Idle request being serviced wait

DSBUFRODR - SYSDB relative pointer to the system buffer element used to read the DSCT. Zero, if no element gotten.

DBADBLK1 - High order logical sector address of the bad block for the Defective Sector Table (DSCT) entry.

DBADBLK2 - Low order logical sector address of the bad block for the DSCT entry.

DBADXFER - Byte transfer left when bad block occurred.

DLOGERROR - CPVR(0) logged on hardware error status.

DSIZOPSTOP - Stopped channel program relative offset location due to an error in CPVR(0).

DSTATUS - 20 bytes disc status logged on status error. (See CS 80 Disc Drive Status).

RPSWORD1 - Flag and local state

RE - Read revision code done.  
 Set if read revision code level is done.  
 DC - RPS revision code.  
 Set if controller is "PEP"ed.  
 DR - RPS desirable.  
 Set if RPS is desirable.  
 EN - RPS enabled.  
 Set if default value for RPS is enabled.  
 IR - Drive is processing a marginal data error

G.01.00  
13- 32

from the drive. Do not return hard error.  
Local State - State of the local request made by driver

- 0 - No local request is being processed
- 1 - Reading rev code
- 2 - Setting default RPS

APSWDR02 - Default value for RPS

- T1 - Time to target in hundreds of microseconds
- T2 - Window size in hundreds of microseconds

G.01.00  
13- 33

#### DIT For 7970 Magnetic Tape

D	1	2	3	4	5	6	7	8	9	10	11	12	15	
D	0	RECT	REQ	0	N	0	I/D	IRK	0	0	0	STATE		DFLAG

2	IDQP													DIDQP
3	LDGICRL DEVICE NUMBER													DLDEV
4	DLT PTR													DDLTP
5	ILT PTR													DILTP
6	RA	RU	SN	CE	DC	HARDWARE STATUS								DSTRT
7	EARDR STATUS													DSERR
8	TIMEDUT FLAGS													DTIME
9	TIMER REQUEST INDEX													DTREQ
10	IOT //////////////////////////////////										PHYSICRL UNIT #			DUNIT
11	13 RB4  RW												DDFLAGS	

IDT - I/D Devices

- 0 - non-HP-IB
- 1 - HP-IB Systems
- 3 - unused
- 4 - unused

DSAVE - Device processing flags.

- RA RABIT - Indicates tape has been rewound.
- RU RABIT - Indicates that a rewind/unload was performed to allow a write-ring mount.
- SN SMDAT - A short read is in progress. After completion of read, EOF is checked for and if not present, the requested bytes are transferred from the short-read buffer to the user's buffer.
- CE CESTAT - Channel parity error processing is in progress.
- DC DSFLAG - Transfer used data chaining - used for computing the transmission log.
- RW - (DDFLAGS, bit 15) if set, tape is rewind.
- RB4 - (bit 14) if set, need to rewind tape before next write.

G.01.00

#### QMISC

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
A	B	F	G	E	S	U	FD	MR	RD	BR	CK				

Where

- A - retry in progress
- B - backspace in progress
- F - forward space in progress
- G - gap in progress
- E - backspace on data end-of-file
- S - short read in progress
- U - unload tape for write ring installation

G.01.00  
13- 35

#### DIT for 7976 Magnetic Tape

There is one DIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the IDQ element. The following diagram shows the DIT used for the mag tape driver.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MEMORNIC
0	0	0	RC	RQ	0	NU	0	ID	IR	0	DI	DI	STATE			DFLAG
1	SYSDB relative pointer to the DIT for the next device requesting this resource or service															DLINK
2	SYSDB relative pointer to the first IDQ in request list for this device															DIDQP
3	Logical device number															DLDEV
4	SYSDB relative pointer to Device Linkage Table															DDLTP
5	SYSDB relative ptr to Interrupt Linkage Table															DILTTP
6	RA	RU	SN		DC	PF										DSAVE
7	Hardware error status. Set when the driver detects an error. Whenever <0>, the driver monitor logs an I/D error and clears this word															DSERR
X10	Bit 0 is set at completion of timer															DTIME
X11	Interrupt status for this unit. Set by the driver each time it processes an interrupt.															DSTAT
X12	IDT /////////////// Physical unit #															DRQST
X13	Holds the time out request entry index while a timer is active.															
X14	Error log. Contains 5 valid bytes of status															DLOGERR

DFLAG - Flags and request state

- RC ACTIVE - R monitor is currently servicing this device.
- RQ REQUEST - A service request is pending while the monitor is active.
- NU MUNIT - This device is on a multi-unit controller.
- ID IDPROG - An I/D Channel Program is running for this device.
- IR IRK - An interrupt or response has occurred for this device.
- ND NDTRDY - Go to state X10 after Idle Channel Program is started.
- ST STWRIT - The device monitor is starting an Idle Channel Program for this device. There is no IDQ associated with this type of request.

G.01.00  
13- 36

STATE - State of the device monitor. Specifies the next action to be taken in SIODM in servicing the request:

- 0 - start new request
- 1 - not used
- 2 - call driver initiator procedure
- 3 - call driver completor procedure
- 4 - not used
- 5 - process request completed
- 6 - initiate device recognition sequence
- 7 - start operator intervention wait
- X10 - wait for interrupt (operator intervention) restart at state 0
- X11 - wait for data segment freeze, then state 2
- X12 - wait for driver initiator to be frozen, then allocate controller (state 2)
- X13 - wait for I/O completion interrupt, then state 3
- X14 - wait for controller, then call driver initiator
- X15 - not used
- X16 - wait for initiator nake present, then state 2
- X17 - wait for completor nake present, then state 3

## OSAVE - Device processing flags

RU RWBIT - Indicates tape has been rewound.  
 RU RWUNLD - Indicates that a rewind/unload was performed to allow a write-ring mount.  
 SN SHORT - A short read is in progress. After completion of read, EOF is checked for and if not present, the requested bytes are transferred from the short-read buffer to the user's buffer.

DC DSFLAG - Transfer used data chaining - used for computing the transmission log.

PF POWER - Device power up indication.

G.01.00  
13- 37

## DSTRT - Flag tape controller status

BITS	USE
0	END OF FILE (EOF)
1	BEGINNING OF TAPE (BOT) / LOAD POINT (LP)
2	END OF TAPE (EOT)
3	SINGLE TRACK ERROR (NOT LOGGED FOR RERDS)
4	COMMAND REJECT (REJECT)
5	FILE PROTECT (NOT WRITE ENABLED; NO WRITE RING)
6	MULTIPLE TRACK ERROR (MTE)
7	UNIT ONLINE
8	GCR (6250 BPI DENSITY)
9	UNIT NUMBER (NSB)
10	UNIT NUMBER (LSB)
11	TIMING ERROR
12	TAPE RUNAWAY
13	REWINDING *
14	UNIT BUSY ** (REPORTED AS UNIT NOT READY)
15	INTERFACE BUSY *

## Card Reader DIT Field Definitions

## DFLAG - Flags and device status

ACTIVE Monitor is currently active servicing this device.  
 REQUEST Service for this device was requested while the monitor was active.  
 IOPROG SIO program in progress.  
 IAK Interrupt occurred or request aborted or preempted.  
 READDOONE Previous read resulted in an EOF with a backup save requested. The data has been saved in an auxiliary buffer and will be passed back on the next read request.  
 NRMESAGE Set when a not ready message has been issued, and cleared when the reader is found ready. Used to prevent multiple Not Ready messages when power is turned on.

NSTATE Monitor State. See SIODM specifications for details.

DLINK - SYSDB relative pointer to the DIT for the next device requesting service for this resource.

IDQP - SYSDB relative pointer to the first IDQ element in the request list for this device.

LDEVN - Logical device number and unit number.

UNIT Unit number of device.

LDEVN Logical device number.

DDLTP - SYSDB relative pointer to driver linkage table (DLT).

DSTRT - Device interrupt status. Contains the device interrupt status at the last interrupt. See hardware ERS for details.

DSERR - Device interrupt error status. If not zero, then holds the device interrupt status from an operation with an erroneous completion status. Causes SIODM to log an error.

DWCNT - Holds the requested transfer count in words.

G.01.00  
13- 40

Device Information Table for HP-IB Card Reader

There is one OIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the IOQ element. The following diagram shows the OIT used for the card reader driver.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MEMONIC
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	STATE
1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	OLINK
2	2	2	2	2	2	2	2	2	2	2	2	2	2	2	2	OIOOP
3	3	3	3	3	3	3	3	3	3	3	3	3	3	3	3	OLDEV
4	4	4	4	4	4	4	4	4	4	4	4	4	4	4	4	ODLTP
5	5	5	5	5	5	5	5	5	5	5	5	5	5	5	5	OILTP
6	6	6	6	6	6	6	6	6	6	6	6	6	6	6	6	OSAVE
7	7	7	7	7	7	7	7	7	7	7	7	7	7	7	7	DSERR

X14	X14	X14	X14	X14	X14	X14	X14	X14	X14	X14	X14	X14	X14	X14	X14	OLOGERROR

DFLAG - Flags and request state  
 RC ACTIVE - R monitor is currently servicing this device.  
 RQ REQUEST - R service request is pending while the monitor is active.  
 MU MUNIT - This device is on a multi-unit controller.  
 IO IOPROG - An I/O Channel Program is running for this device.  
 IR IAK - An interrupt or response has occurred for this device.  
 NO NOTROY - Go to state X10 after Idle Channel Program is started.  
 ST STWRIT - The device monitor is starting an Idle Channel Program for this device. There is no IOQ associated with this type of request.

G.01.00  
13- 41

STATE - State of the device monitor. Specifies the next action to be taken in SIOBH in servicing the request:  
 0 - start new request  
 1 - not used  
 2 - call driver initiator procedure  
 3 - call driver completor procedure  
 4 - not used  
 5 - process request completed  
 6 - initiate device recognition sequence  
 7 - start operator intervention wait  
 X10 - wait for interrupt (operator intervention) restart at state 0  
 X11 - wait for data segment freeze, then state 2  
 X12 - wait for driver initiator to be frozen, then allocate controller (state 2)  
 X13 - wait for I/O completion interrupt, then state 3  
 X14 - wait for controller, then call driver initiator  
 X15 - not used  
 X16 - wait for initiator make present, then state 2  
 X17 - wait for completor make present, then state 3

DLDEV - Device logical device number  
 IOT I/O TYPE - I/O System type  
 0 = Series II / III I/O system  
 1 = HP-IB Systems  
 2 = unused  
 3 = unused

OSAVE - Device processing flags  
 RO REROONE - R card has already been read.  
 RF RBORTFLAG - R device clear has already been sent for this series of aborted IOQs.

G.01.00  
13- 42

2608 Line Printer OIT (HP-IB Systems)

There is one OIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the IOQ element (however, there is only one device per 2608 controller.) The following diagram shows the OIT used for the 2608 line printer driver.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MEMONIC

WORD 0 - EACH BIT IS THE 'OR' OF ONE WORD IN THE TABLE (EXCEPT  
 BIT 0 WHICH IS NOT USED). THEREFORE, BIT (1:1) IS SET  
 IF WORD 1 IN THE TABLE IS NON-ZERO.

WORD 1 - BIT= 0 - (OF) ONLINE/OFFLINE BIT.  
 1 - (MS) MESSAGE BEING DISPLAYED ON THE 2680A/2688A CONSOLE.  
 2 - (PW) POWER UP COMPLETED SINCE LAST I/O STATUS READ.  
 3 - (PE) PARITY ERROR DETECTED ON PM1 COMMAND.  
 4 - (TE) TRANSMISSION ERROR DETECTED IN THE PRINTER.  
 5/15 - RESERVED. UNUSED.

WORD 2 - NOT USED. RESERVED.

WORD 3 - MCS FAULT NUMBER. CONTAINS AN INTEGER DESCRIBING THE LAST  
 FAULT TO OCCUR SINCE THE LAST TIME THE I/O STATUS WAS READ  
 OR THE NP 2680A/2688A WAS POWERED DOWN. IF THE WORD IS ZERO THERE

G.01.00  
 13- 50

I / O

IS NO MCS FAULT. SEE OCS ERS FOR A DESCRIPTION OF THE MCS  
 FAULT NUMBERS.

WORD 4 - BIT= 0 - (CL) NO ADDN FOR ATTEMPTED CHARACTER SET LOAD.  
 1 - (FL) NO ADDN FOR ATTEMPTED FDR LOAD.  
 2 - (VL) NO ADDN FOR ATTEMPTED VFC LOAD.  
 3 - (CU) ATTEMPT TO PRINT DATA AND THERE IS NO CURRENTLY  
 SELECTED CHARACTER SET.  
 4 - (FU) ATTEMPT TO SELECT AN UNDEFINED FORM SET.  
 5 - (VU) ATTEMPT TO PRINT DATA AND THERE IS NO CURRENTLY  
 SELECTED VFC SET.  
 6 - (IL) ATTEMPT TO PRINT DATA AND THERE IS NO CURRENTLY  
 SELECTED LOGICAL PAGE TABLE (LPT) ENTRY.  
 7 - (IP) ATTEMPT TO MOVE PEN OFF THE LOGICAL PAGE.  
 8 - (ST) THE 2680A/2688A COULD NOT PROCESS ALL OF THE DATA  
 BEFORE IT WAS SUPPOSED TO BE TRANSFERRED TO THE  
 DRUM/PAPER. DATA WAS LOST!  
 9 - (SB) SPOOLER BLOCK CONTAINS FORMAT ERROR.  
 10 - (IR) INVALID RECOVERY BLOCK RECEIVED FROM SPOOLER.  
 11 - (MP) MAXIMUM NUMBER OF COPIES PER PHYSICAL PAGE  
 HAS BEEN EXCEEDED. THIS IS A RESULT OF THE  
 SPOOLER PROCESS SETTING THE MAXIMUM COPIES PER  
 PAGE WITH FUNCTION CODE 132.  
 12 - (NJ) R COMMAND OR FUNCTION CODE WAS RECEIVED WHEN NO  
 "JOB" WAS IN PROGRESS. THE COMMAND OR FUNCTION WAS  
 IGNORED BY THE DCS.  
 13 - (NM) NO MEMORY. 2680A/2688A DYNAMIC MEMORY RELOCATION HAS  
 DETECTED THAT MAIN MEMORY IS COMPLETELY OCCUPIED WITH  
 CHARACTER SETS, VFC'S, FORMS AND DATA SUCH THAT THE  
 2680A/2688A CANNOT PROCESS THE CURRENT INPUT DATA. DATA  
 WILL BE LOST!  
 14 - (TL) ATTEMPT TO PRINT DATA AND THERE ARE MORE THAN  
 THE MAXIMUM ALLOWABLE LOGICAL PAGE TABLE (LPT)  
 ENTRIES SELECTED.  
 15 - (NC) A NON-EXISTENT VFC CHANNEL WAS SKIPPED TO.

WORD 5 - BIT= 0 - (LP) LOGICAL PAGE TRUNCATED TO FIT PHYSICAL PAGE.  
 1 - (PF) PAGE SIZE REQUIRED BY PROGRAMMER DIO NOT  
 MATCH PAGE SIZE SET BY OPERATOR. OPERATOR PAGE  
 SIZE PREVAILS.  
 2 - (NC) NO CHARACTER SET SELECTED.

WORDS 6/11 NOT USED BUT RESERVED FOR FUTURE USE.

WORDS 12/13 - THE RECORD NUMBER WHICH CONTAINS THE OFFENDING ERROR  
 AS DEFINED BY WORD FOUR. IF A POWER FAIL OCCURS DURING  
 A "JOB", THE POWER FAIL BIT IS SET AND A SHEET NUMBER IS  
 MADE AVAILABLE IN WORDS FOURTEEN AND FIFTEEN. HOWEVER,  
 THE RECORD NUMBER IS LOST AND CANNOT BE REPORTED. THESE  
 WORDS OCCUR IN A "JOB" ONLY.

WORDS 14/15 - THE SHEET NUMBER ON WHICH THE ERROR OCCURRED AS DEFINED  
 BY WORD FOUR. IF AN ERROR OCCURS IN THE ENVIRONMENT FILE  
 AT THE START OF A "JOB", THEN THIS NUMBER WILL BE ZERO.

G.01.00  
 13- 51

I / O

IN ADDITION, WHEN A POWER FAIL OCCURS DURING A "JOB",  
 THE POWER ON BIT IS SET IN WORD ONE AND THE SHEET  
 NUMBER OF THE LAST SUCCESSFULLY TRANSFERRED PAGE IS  
 PLACED HERE. THIS INFORMATION IS FOR USE BY THE  
 SPOOLER SHOULD A RECOVERY OF A "JOB" BE DETERMINED.  
 THESE WORDS OCCUR IN "JOB" ONLY.

ALL WORDS OF THE I/O STATUS ARE CLEARED WHENEVER THE STATUS BLOCK  
 IS RETURNED TO THE HOST. IT IS UP TO THE HOST CPU TO RETAIN ANY  
 ONGOING STATUS BITS REQUIRED.

## QMISC -

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
ID03	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

## WHERE:

.(0:1) - MB USER REQUESTED TRANSFER IN EXCESS OF 4096  
 WORDS. THE DRIVER CAN WRITE UP TO 4096 WORDS  
 TO THE 2680A/2688A. IN ORDER TO HANDLE UP TO 32K  
 WORDS, MULTIPLE WRITES ARE USED WITHOUT A  
 RETURN TO THE USER AND CALLED THE DRIVER.  
 THIS BIT INDICATES THAT MULTIPLE WRITES ARE  
 BEING DONE TO THE 2680A/2688A.

.(1:1) - RB THE CURRENT WRITE BLOCK MUST BE RETRIED.

.(2:1) - AB USER REQUESTED ABORT IN PROGRESS FLAG.

.(3:1) - IO I/O STATUS HAS BEEN READ AND IS AVAILABLE.

.(4:1) - TO GENERAL I/O CONTROLLER TIMED OUT.

.(5:4) - RESERVED NOT CURRENTLY USED.

.(9:3) - XFER 2680A/2688A TRANSFER ERROR COUNTER.

.(12:3) - PARITY CHANNEL PROGRAM COMMAND PARITY ERROR COUNTER.

.(15:1) - RESERVED NOT CURRENTLY USED.

\*\*NOTE\*\* IN THE ABOVE, SINGLE BIT FIELDS ARE AS DEFINED  
 WHEN THE BIT IS A LOGIC "1".

G.01.00  
 13- 52

Disc Request Table and Disc Requests

Requests for disc transfers are effected by acquiring an entry from the Disc Request Table (DISCREDTAB), filling the proper information, and calling the DISCRANRGER to link the request into the device's doubly linked request queue. The head and tail of a device's request queue are contained in the device's DIT.

DISCREDTABG.01.00

G.01.00  
13- 55

Word 0 - QFLAG - Request dependent flags

Bit 0 - .ABORT Request has been aborted externally.

Bit 1 - .MWRD Request is for a segment transfer.

Bit 2 - .OZAG Diagnostic request (not used).

Bit 3 - .SBUF System Buffer. Target is a system buffer whose index is relative to the start of the SBUF table.

Bit 4 - .IOWAKE Wake caller on completion of request.

Bit 5 - .BLOCKED Blocked I/D. Caller is waited in ATTACHED until request is completed.

Bit 6 - .COMPLETED Request has been completed and caller woken if he had specified.

Bit 7 - .DATAFAM Data segment has been made present and is frozen.

Bit 8 - .NAMEARORD NAM error on data segment make present.

Bit 9 - .PREQUEUED Request is queued into disc's req queue

Bit 10 - .SFALL Start SID failure in GIP.

Bit 11 - .PFALL The I/D has been aborted because of a powerfail.

Bit 12 - .CURREQ Request is device's current request.

Bit 13 - .DISABLED Request is disabled.

Bit 14 - .LDR Request in local DRQ.

Bit 15 - .INLOCRL Buffer DST is in process locality.

Word 2 - LDEVN - Logical Device Number

Word 3 - DMISC - Device dependent.

Word 4 - DDSTN - If SYSBUFRs is clear then this is the DST number of the target data segment. If bit D is set then buffer address is a DB offset value instead of segment relative offset (implemented for NDWRIT ID and NDBUFF).

Word 5 - QDDOR - Offset in data segment or sys buff table to target data buffer.

Word 6 - DFUNC.FUNC - Function code and qualifiers as specified by driver.

G.01.00  
13- 56

Word 7  
QXFERCNT-On initiation specifies the word count if positive or byte count if negative. At completion of the request this location contains the actual transmission count in the same units as the call. Certain control requests return data through this location.

Word 8  
QPAR1 - Parameter one, defined by driver

Word 9

QPAR2 - Parameter two, defined by driver

QMISC - Miscellaneous request dependent storage available to driver.

Word 10

QSTAT.PCBM - PCB Number of process which made this request. Zero if not associated with any process and IOQ is to be returned by the system.

.QUALIFIER - A code which further defines or qualifies the general status. Defined by driver.

.STATUS - General Status. Indicates current and result state of the request according to the following codes.

0 - not started or awaiting completion.

1 - successful completion.

2 - end of file detected.

3 - unusual condition.

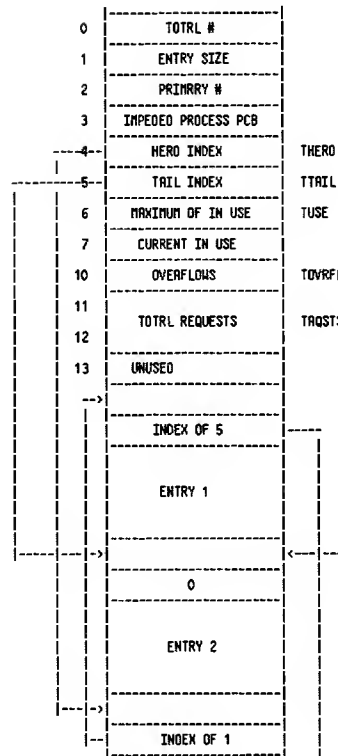

4 - irrecoverable error.

NOTE: See I/O System Status Returns.

Word 11 - bit 0=1 Q element is on free list.

G.01.00  
13- 57

QFLAG - Request dependent flags

Bit 0 .ABORT Request has been aborted externally.

Bit 1 .SPECIAL Special handling is to be applied to this request. For disc, indicates a memory management request.

Bit 2 .DIAG Diagnostic request (not used).

Bit 3 .SBUF System Buffer. Target is a system buffer whose index is relative to the start of the SBUF table.

Bit 4 .IOWAKE Wake caller on completion of request.

Bit 5 .BLOCKED Blocked I/O. Caller is waited in ATTACHIO until request is completed.

Bit 6 .COMPLETED Request has been completed and caller woken if he had specified.

G.01.00  
13- 60

I/O Queue Element (Cont.)

Bit 7 .DATAFRZN Data segment has been made present and is frozen.

Bit 8 .MAMERROR MAM error on data segment makes present.

Bit 9 .PREQ This request has been started but was preempted by a MAM request.

Bit 10 .SFRIL Start SIO Failure in GIP.

Bit 11 .PFRIL The I/O has been aborted because of a powerfail.

Bits 12-13 .PREEMPT Preemptive type code: 1-soft, 2-hard.

Bit 15 .MSGDONE R message request reply has completed.

QLINK - Table relative index of next IOQ element. Points to first word of element.

QLDEV - Logical Device Number

QMISC - Device dependent.

QOSTN - If SYSBUFF is clear then this is the OST number of the target data segment. If bit 0 is set then buffer address is a 0B offset value instead of segment relative offset (Implemented For HOWAIT IO and NOBUFF).

QRODR - Offset in data segment or sys buff table to target data buffer.

QFUNC.FUNC - Function code and qualifies as specified by driver.

QMBCT - On initiation specifies the word count if positive or byte count if negative. At completion of the request this location contains the actual transmission count in the same units as the call. Certain control requests return data through this location.

QPRR1 - Parameter one, defined by driver

QPRR2 - Parameter two, defined by driver

QMISC - Miscellaneous request dependent storage available to driver.

QPCBN - PCB Number of process which made this request. Zero if not associated with any process and IOQ is to be returned by the system.

.QUALIFIER - R code which further defines or qualifies the general status. Defined by driver.

.STATUS - General Status. Indicates current and result state of the request according to the following codes.

- 0 - not started or awaiting completion.
- 1 - successful completion.
- 2 - end of file detected.
- 3 - unusual condition.
- 4 - irrecoverable error.

Word 11 bit 0 - Queue element is on free list.

Function code for this request. (See next section.)																QFUNC
On initiation, specifies the word count (>0) or byte count (<0). At completion of the request this location contains the actual transmission count in the same units (bytes or words) as in the request.																QMBCT
Parameter 1. Used only for reads. Contains the EOF specification in bits (13:3).																QPRR1
Parameter 2. Used only for writes. IF bit (13:1) is set, writing past EOT is allowed.																QPRR2
QUALIFIER   STATUS																QOSTAT
PCB NUMBER																

## QFLAG - Request dependent flags

Bit 0 ABORT - Abort this request and return an error indication to the caller.

Bit 1 SPECIAL - Apply special handling to this request. (Not used)

Bit 2 DIAG - This is a request from the diagnostic subsystem. (Not used)

Bit 3 SYSBUFF - Target is an index relative to the SBUF table of the data buffer.

Bit 4 IDUAKE - Wake caller on completion of request.

Bit 5 BLOCKED - Blocked I/O. The caller is waited in ATTACHIO

G.01.00  
13- 64

- Bit 6 COMPLETED - until the request is completed. Implies IOWAKE.
- Bit 7 DATAFRZN - The request has been completed and the caller awakened if he had requested (with IOWAKE).
- Bit 8 NAMEADRO - Set by the memory management routines (MM) when a MAKEPRESENT request is successfully completed and indicates the data segment is frozen in memory.
- Bit 9 NAMEADRO - An error has occurred while MM was trying to make the target data segment present and freeze it in memory.
- Bit 9 PREQ - (Not used)
- Bit 10 SFAIL - Delayed failure of SIO instruction. If a call to STARTNPB resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.
- Bit 11 PFAIL - The request was aborted because of a system power failure.

QMISC - Driver request dependent flags and counters. Used mostly for  
error retries.

RETRY	- Indicates an error retry is in progress.
BACK	- Backspace record processing for an error retry is in progress.
FORWARD	- Forward space record processing for an error retry is in progress.
GAP	- Gap processing for an error retry is in progress.
BOEOF	- Backspace record due to a data EOF processing is in progress.
TDOUTCNTA	- GIC timed-out counter.
FSCENTA	- Forward space record counter.
BSCENTA	- Backspace record counter.
RETCNTA	- Error retry counter.

QSTAT - PCB number and request completion status.

PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.

STATUS - General status indicating the final state of the request. The following codes are used:

- 0 - Not started or awaiting completion.
- 1 - Successful completion.
- 2 - End-of-file detected.
- 3 - Unusual, but recoverable, condition detected.
- 4 - Irrecoverable error has occurred.

QUALIFIER - A code which further defines or qualifies the general status. (See the section Oriver Return Status Codes.)

G.01.00

**QFLAG** - Request dependent flags

Bit 0	ABORT	- Abort this request and return an error indication to the caller.
Bit 1	SPECIAL	- Apply special handling to this request. (Not used)
Bit 2	DIAG	- This is a request from the diagnostic subsystem.
Bit 3	SYSBUFF	- <i>Argid</i> is an index relative to the SBUF table of the data buffer.
Bit 4	IOWAKE	- Wake caller on completion of request.
Bit 5	BLOCKED	- Blocked I/O. The caller is waited in ATTACHNO until the request is completed. Implies IOWAKE.
Bit 6	COMPLETED	- The request has been completed and the caller awakened if he had requested (with IOWAKE).
Bit 7	DATAFRZN	- Set by the memory management routines (MM) when a

G.01.00  
13- 66

MAKEPRESENT request is successfully completed and indicates the data segment is frozen in memory.

Bit 8 MAKEERROR - An error has occurred while MAN was trying to make the target data segment present and freeze it in memory.

Bit 9 PREQ - (Not used)

Bit 10 SFAIL - Delayed failure of SIO instruction. If a call to STARTI/O resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.

Bit 11 PFAIL - The request was aborted because of a system power failure.

QSTAT - PCB number and request completion status.

PCBN	- The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IDQ element is to be returned by the system when the request has completed.
RSTATUS	- General status indicating the final state of the request. The following codes are used:

- 0 - Not started or awaiting completion.
- 1 - Successful completion.
- 2 - End-of-file detected.
- 3 - Unusual, but recoverable, condition detected.
- 4 - Irrecoverable error has occurred.

QUALIFIER - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

## QFLAG - Request dependent flags

- Bit 0 ABORT - Abort this request and return an error indication to the caller.
- Bit 1 SPECIAL - Apply special handling to this request. (Not used)
- Bit 2 DIAG - This is a request from the diagnostic subsystem. (Not used)
- Bit 3 SYSBUFF - Target is an index relative to the SBUF Table of the data buffer.
- Bit 4 IOWAKE - Wake caller on completion of request.
- Bit 5 BLOCKED - Blocked I/O. The caller is waited in ATTACHIO until the request is completed. Implies IOWAKE.
- Bit 6 COMPLETED - The request has been completed and the caller awakened if he had requested (with IOWAKE).

G.01.00  
13- 63

- Bit 7 DATAFRZN - Set by the memory management routines (MM) when a MAKEPRESENT request is successfully completed and indicates the data segment is frozen in memory.
- Bit 8 MAHERRORR - An error has occurred while MM was trying to make the target data segment present and freeze it in memory.
- Bit 9 PRED - (Not used)
- Bit 10 SFAIL - Delayed failure of SID instruction. If a call to STARTIO resulted in the request being added to the channel queue, this bit indicates that the SID instruction failed when the request was selected for execution.
- Bit 11 PFAIL - The request was aborted because of a system power failure.

## QMISC - Driver request dependent flags and counters.

- PRE'TO'POST - Pre to post spacing change flag.
- PEJECT - Last operation was a page eject.
- MASTERCLR - Master clear done to clear powerfail bit in status. Master clear needs to be done from not ready condition.
- TOUTCNTR - Channel time-out retry counter.
- WRITECODE - Indicates type of wait:  
0 - new request  
1 - completion wait  
2 - not ready wait

## QSTAT - PCB number and request completion status.

- PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.
- STATUS - General status indicating the final state of the request. The following codes are used:  
0 - Not started or waiting completion.  
1 - Successful completion.  
2 - End-of-file detected.  
3 - Unusual, but recoverable, condition detected.  
4 - Irrecoverable error has occurred.
- QUALIFIER - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

G.01.00  
13- 70

## 2608 Line Printer Request Codes

Operation	Function	Parameters
WRITE	1	P1 - Vertical Format Specification 1 - use 1st data char as format spec  X53 - "+", print and suppress spacing X55 - "-", print and triple space X60 - "0", print and double space X61 - "1", print and top of form  X200-X277, print and space N-X200 lines X300-X377, print with channel N-X277  R11 others, print and single space.  P2 - Space Mode Flag (15:1) - Prepace flag if set, print then fill buffer if clear, fill buffer then print (14:1) - No page stepover flag if set, single and double space without stepover (66 lines/page) if clear, single and double space with stepover (60 lines/page)
FILE OPEN	2	Page eject if not at top of form
FILE CLOSE	3	Page eject if not at top of form
DEVICE CLOSE	4	Page eject if not at top of form
READ STATUS	X17	Read I/O status Count - buffer must be at least 2 bytes
VFC SET	X100	Load VFC RAM Count - form length in words (0 loads RAM from internal ROM) P1 - 6 for 6 LPI or 8 for 8 LPI any other value defaults to 6 LPI
TRB SET	X101	Set logical column definition P1 - 0 to 15, any other value defaults to 15

G.01.00  
13- 71

## 2619R &amp; 2631 Line Printer IOQ Element (HP-IB Systems)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	NAME/COMMENT
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	QFLAG
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	QLINK	Request dependent flags (see below)
2	3	4	5	6	7	8	9	10	11	12	13	14	15	QDEV	QLINK	SYSDR relative pointer to next IOQ element. Points to first word of element.
3	4	5	6	7	8	9	10	11	12	13	14	15	QMISC	QDEV	QLINK	Logical device number
4	5	6	7	8	9	10	11	12	13	14	15	QOSTN	QMISC	QDEV	QLINK	3) PP PE PF TOUTCNTR   WRITECODE
5	6	7	8	9	10	11	12	13	14	15	QADDR	QOSTN	QMISC	QDEV	QLINK	4) S  If QFLAG.(3:1) is clear then this is the OST number of the target data segment. If S is set, QADDR is DB relative.
6	7	8	9	10	11	12	13	14	15	QFUNC	QADDR	QOSTN	QMISC	QDEV	QLINK	5) Offset in the data segment or system buffer table to the target data buffer.
7	8	9	10	11	12	13	14	15	QUBCT	QFUNC	QADDR	QOSTN	QMISC	QDEV	QLINK	6) Function code for this request. (See next section.)
8	9	10	11	12	13	14	15	QUBCT	QFUNC	QADDR	QOSTN	QMISC	QDEV	QLINK	QUBCT	On initiation, specifies the word count (>0) or byte count (<0). At completion of the request this location contains the actual transmission count in the same units (bytes or words) as in the request.
9	10	11	12	13	14	15	QPAR1	QUBCT	QFUNC	QADDR	QOSTN	QMISC	QDEV	QLINK	QUBCT	10) Parameter 1. Vertical Format specification. (See next section for details.)

## QFLAG - Request dependent flags

- Bit 0 ABORT - Abort this request and return an error indication to the caller.
- Bit 1 SPECIAL - Apply special handling to this request. (Not used)
- Bit 2 DIAG - This is a request from the diagnostic subsystem. (Not used)
- Bit 3 SYSBUFF - Target is an index relative to the SBUF Table of the data buffer.
- Bit 4 IOWAKE - Wake caller on completion of request.
- Bit 5 BLOCKED - Blocked I/O. The caller is waited in ATTACHIO

G.01.00  
13- 72

- until the request is completed. Implies IDWAKE.
- Bit 6 COMPLETED - The request has been completed and the caller awakened if he had requested (with IDWAKE).
- Bit 7 DATAFZN - Set by the memory management routines (MM) when a MAKEPRESENT request is successfully completed and indicates the data segment is frozen in memory.
- Bit 8 NAMEERRORD - An error has occurred while MM was trying to make the target data segment present and freeze it in memory.
- Bit 9 PREQ - (Not used)
- Bit 10 SFAIL - Delayed failure of SIO instruction. If a call to STARTIO resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.
- Bit 11 PFRIL - The request was aborted because of a system power failure.

## QMISC - Driver request dependent flags and counters for 2631.

- PRE'TD'POST - Pre to post spacing change flag.
- PEJECT - Last operation was a page eject.
- TOUTCNTA - Channel time-out retry counter.
- POWERFAIL - Power fail flag indicates power fail occurred.
- WRITECODE - Indicates type of wait:
- 0 - new request
  - 1 - completion wait
  - 2 - not ready wait

G.01.00  
13- 73

## Format for 2619A

0	1	2	3	4	12	15
PP	PE	PF	TO	BF	WAITCODE	

- TOUT - Channel timed out flag
- BUF'FILL - Buffer fill operation in progress

## QSTRT - PCB number and request completion status.

- PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.
- STATUS - General status indicating the final state of the request. The following codes are used:
- 0 - Not started or awaiting completion.
  - 1 - Successful completion.
  - 2 - End-of-file detected.
  - 3 - Unusual, but recoverable, condition detected.
  - 4 - Irrecoverable error has occurred.
- QURLIFIER - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

G.01.00  
13- 74

## 2619 Line Printer Request Codes

Operation	Function	Parameters
WRITE	1	<p>P1 - Vertical Format Specification</p> <p>1 - Use 1st data char as format specification.</p> <p>X53 - "*", print and suppress spacing</p> <p>X55 - " ", print and triple space</p> <p>X60 - "0", print and double space</p> <p>X61 - "1", print and top of form</p> <p>X200-X277, print and space N-X200 lines</p> <p>X300-X312, print with channel N-X277</p> <p>X320 - Fill Line Printer Buffer Only</p> <p>All others, print and single space.</p> <p>P2 - Space Mode Flags</p> <p>(15:1) - Prespace Flag</p> <p>if set, print then fill buffer</p> <p>if clear, fill buffer then print</p> <p>(14:1) - No page stepover flag</p> <p>if set, single and double space without stepover (66 lines/page)</p> <p>if clear, single and double space with stepover (60 lines/page)</p>
FILE OPEN	2	Page eject if not at top of form
FILE CLOSE	3	Page eject if not at top of form
DEVICE CLOSE	4	Page eject if not at top of form
RERO STATUS	X17	Read I/O status Count - buffer size
*IDENTIFY	X110	Return IO value in Bank & Buffaddr
*SELF TEST:		
INITIATE	X111	Subtest number to execute in Bank and Buffaddr (subtest number ranges from 0 to 7)
STATUS	X112	Subtest result returned in Bank & Buffaddr
*LOOPBACK TEST:		
WRT ORTR	X113	Data to LP in Bank & Buffaddr [PING]
RERO ORTR	X114	Data from LP read into Bank & Buffaddr [PONG] Count - Buffer Size (256 bytes max)

## I/O Queue Element For HP-IB Card Reader

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MEMONIC
Request dependent flag (see below)																QFLAG
SYSDB relative pointer to next IOQ element. Points to first word of element.																QLINK
Logical device number																QLDEV
Auxiliary buffer flag.																QMISC
S IF QFLAG(3:1) is clear then this is the DST number of the target data segment. If S is set, QADDR is DB relative.																QDSTN
Offset in the data segment or system buffer table to the target data buffer.																QADDR
Function code for this request. (See next section.)																QFUNC
On initiation, specifies the word count (>0) or byte count (<0). At completion of the request this location contains the actual transmission count in the same units (bytes or words) as in the request.																QMBCT
Parameter 1. Contains the EOF specification																QPAR1
Parameter 2. Contains the data node specification in bits (11:2). (See below card reader request codes for detail information)																QPAR2
QUALIFIER   STATUS																DSTAT
PCB NUMBER																QPCBN

## QFLAG - Request dependent flags

- Bit 0 ABORT - Abort this request and return an error indication to the caller.
- Bit 1 SPECIAL - Apply special handling to this request. (Not used)
- Bit 2 DIAG - This is a request from the diagnostic subsystem.
- Bit 3 SYSBUFF - Target is an index relative to the SBUF Table of the data buffer.
- Bit 4 IOWAKE - Wake caller on completion of request.
- Bit 5 BLOCKED - Blocked I/O. The caller is waited in ATTACHID until the request is completed. Implies IOWAKE.

G.01.00  
13- 77

- Bit 6 COMPLETED - The request has been completed and the caller awakened if he had requested (with IOWAKE).
- Bit 7 DATAFZN - Set by the memory management routines (MM) when a MAKEPRESENT request is successfully completed and indicates the data segment is frozen in memory.
- Bit 8 NAMEERRORD - An error has occurred while MM was trying to make the target data segment present and freeze it in memory.
- Bit 9 PREQ - (Not used)
- Bit 10 SFAIL - Delayed Failure of SIQ instruction. If a call to STARTIQ resulted in the request being added to the channel queue, this bit indicates that the SIQ instruction failed when the request was selected for execution.
- Bit 11 PFAIL - The request was aborted because of a system power failure.

QMISC - Auxiliary buffer flag used to indicate a read into the driver's buffer and not the user's buffer.

QSTAT - PCB number and request completion status.

- PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.
- STATUS - General status indicating the final state of the request. The following codes are used:
- 0 - Not started or awaiting completion.
  - 1 - Successful completion.
  - 2 - End-of-file detected.
  - 3 - Unusual, but recoverable, condition detected.
  - 4 - Irrecoverable error has occurred.
- QUALIFIER - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

## CS 89 Disc Request Queue Element (IOQ)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MEMONIC
Request dependent flag (see below)																QFLAG
Request urgency class																QURGCLASS
Logical device number																QLDEV
CHANNEL   AS   OP   IN   SR   RTRN   LF   SP   WAITCODE																QMISC
S   DST (IF process disc I/O)   DST (IF segment transfer) [S=Stack]																QDSTN
Offset in the data seg (IF process disc I/O)   Address in Bank (IF segment transfer)																QADDR
Unit #   Function code for this request.																QFUNC
On Initiation, specifies the word count (>0) or byte count (<0). At completion of the request this location contains the actual transmission count in the same units (bytes or words) as in the request.																QMBCT
P1 - Parameter 1 (Usually High Order of Current Logical Disc Address [CLDRI])																QPAR1
P2 - Parameter 2 (Usually Low Order of Current Logical Disc Address [CLDR2])																QPAR2
QUALIFIER   STATUS																DSTAT
PCB																QPCBN
Sysbase relative index of previous request in queue																QPREVREQ
Sysbase relative index of next request in queue																QNEXTREQ
Segment identifier (IF seg transfer) --																QSEGIDENT
DISPLACEMENT OF READ OR WRITE FROM SEG BASE(M)																QSEGDISP

## QFLAG - Request dependent flags

G.01.00  
13- 79

- Bit 0 ABORT - Request has been aborted externally.
- Bit 1 NAMEREQ - Request is for a segment transfer.
- Bit 2 DIAG - This is a request from the diagnostic subsystem.
- Bit 3 SBUF - Target is an index relative to the SBUF Table of the data buffer.
- Bit 4 IOWAKE - Wake caller on completion of request.
- Bit 5 BLOCKED - Blocked I/O. The caller is waited in ATTACHID until the request is completed. Implies IOWAKE.
- Bit 6 COMPLETED - The request has been completed and the caller awakened if he had requested (with IOWAKE).
- Bit 7 DATAFZN - Data segment has been present and is frozen.
- Bit 8 NAMEERRORD - An error has occurred while MM was trying to make the target data segment present and freeze it in memory.
- Bit 9 PREQUESTED - Request is queued into disc's request queue
- Bit 10 SFAIL - Delayed Failure of SIQ instruction. If a call to STARTIQ resulted in the request being added to the channel queue, this bit indicates that the SIQ instruction failed when the request was selected for execution.
- Bit 11 PFAIL - The request was aborted because of a system power failure.
- Bit 12 CURREQ - Request is device's current request.
- Bit 13 DISABLED - Request is disabled.
- Bit 14 DISATNPT - Attempt to disable this request.
- Bit 15 MSGDONE - A message request reply has completed.

QLDEV, QLDEVN - Logical Device Number

QMISC - Driver request dependent flags and counters.

- CHAN'ERR'FLG - Channel error retry flag.
- ASTAT'FAIL'FLG - Request status failed flag.
- OPER'REQ'FLG - Operator requested release flag.
- IN'FAULT'FLG - Internal maintenance fault flag.
- STAT'ATRY'FLG - Status error single retry flag.
- ATRN'REQ'FLG - Retransmit required flag.
- LDAD'FLG - Media load flag.
- SYS'PFAIL'FLG - System powerfail flag.

WAITCODE - Indicates type of wait:

- 0 - new request
- 1 - completion wait
- 2 - not ready wait
- 3 - release/release deny wait
- 4 - IOQ defer wait
- 5 - DSC read wait
- 6 - DSC write wait
- 7 - synchronization wait

QDSTN - If system buffer is clear then this is the DST number of the target data segment. If bit 0 is set then buffer address is a DB offset value

G.01.00  
13- 80

instead of segment relative offset (implemented for NOWAIT I/O and NOBUFF).

QADDR - Offset in data segment or system buffer table to target data buffer.

QFUNC - Function code and qualifiers as specified by driver.

QSTAT - PCB number and request completion status.

PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IDQ element is to be returned by the system when the request has completed.

STATUS - General status indicating the final state of the request.

- 0 - Not started or awaiting completion.
- 1 - Successful completion.
- 2 - End-of-file detected.
- 3 - Unusual, but recoverable, condition detected.
- 4 - Irrecoverable error has occurred.

QUALIFIER - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

QFLAG - Request dependent flags

G.01.00  
13- 82

- Bit 0 ABORT - Request has been aborted externally.
- Bit 1 MREQ - Request is for a segment transfer.
- Bit 2 DIAG - This is a request from the diagnostic subsystem.
- Bit 3 SBUF - Target is an index relative to the SBUF Table of the data buffer.
- Bit 4 IDWAKE - Wake caller on completion of request.
- Bit 5 BLOCKED - Blocked I/O. The caller is waited in ATTACNID until the request is completed. Implies IDWAKE.
- Bit 6 COMPLETED - The request has been completed and the caller awakened if he had requested (with IDWAKE).
- Bit 7 DATAFRZN - Data segment has been present and is frozen.
- Bit 8 MAMERRORD - An error has occurred while MAM was trying to make the target data segment present and freeze it in memory.
- Bit 9 PREQUEUED - Request is queued into disc's request queue
- Bit 10 SFRAIL - Delayed failure of SID instruction. If a call to STARTIO resulted in the request being added to the channel queue, this bit indicates that the SID instruction failed when the request was selected for execution.
- Bit 11 PFAIL - The request was aborted because of a system power failure.
- Bit 12 CURREQ - Request is device's current request.
- Bit 13 DISABLED - Request is disabled.
- Bit 14 DISATMPT - Attempt to disable this request.
- Bit 15 MSGDONE - A message request reply has completed.

QLDEV.QLDEVN - Logical Device Number

QMISC - Driver request dependent flags and counters.

- CNAN'ERR'FLG - Channel error retry flag.
- RSTAT'FAIL'FLG - Request status failed flag.
- OPER'REQ'FLG - Operator requested release flag.
- INT'FAULT'FLG - Internal maintenance fault flag.
- RETRY'COUNT - Retry count area.
- LOAD'FLG - Media load flag.
- SYS'PFAIL'FLG - System powerfail flag.

WAITCODE - Indicates type of wait:

- 0 - new request
- 1 - completion wait
- 2 - not ready wait
- 3 - release/release deny wait
- 4 - IDQ defer wait
- 5 - DSCT read wait
- 6 - DSCT write wait
- 7 - synchronization wait

QDSTN - If system buffer is clear then this is the DST number of the target data segment. If bit 0 is set then buffer address is a DB offset value

G.01.00  
13- 83

instead of segment relative offset (implemented for NOWAIT I/O and NOBUFF).

QADDR - Offset in data segment or system buffer table to target data buffer.

QFUNC - Function code and qualifiers as specified by driver.

QSTAT - PCB number and request completion status.

PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IDQ element is to be returned by the system when the request has completed.

STATUS - General status indicating the final state of the request.

- 0 - Not started or awaiting completion.
- 1 - Successful completion.
- 2 - End-of-file detected.
- 3 - Unusual, but recoverable, condition detected.
- 4 - Irrecoverable error has occurred.

QUALIFIER - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

G.01.00  
13- 84

SBUF Table Layout

3 - 1 - 5 - 4 - 2

G.01.00  
13- 85Table Element Allocation (SBUF)

The allocation of the elements in the IOQ terminal buffer (TBUF) and system buffer (SBUF) tables is of concern to the I/O system.

FREE LIST OF TABLE ELEMENTS

These tables are in the form of a free-linked list of the free elements. For the SBUF's the -1 word of entry is the link to the next element. For the TBUF's, word zero is the link and word 1 is the link for the IOQ elements.

Each word has an 11-word header beginning at the base of the table. The first six words of the header are for managing the table and the second five are for monitoring table activity.

The entries follow the header at word eleven.

ELEMENT ALLOCATION

Elements are obtained from the beginning of the free list, pointed to by the head and returned to the end of the free list pointed by the tail.

When the free list is empty, the head index is zero and the tail index is set to point at the head index.

The tables are divided into two areas: a primary and a secondary area. Most requests are obtained from the primary area. The secondary area is used only for critical requirements when the primary area is exhausted. These areas are logical areas determined by parameters in the header.

The utility of the core resident tables is seriously reduced if their use is not restricted to dynamic situations.

One of three responses must be specified to the routines which allocate elements from the I/O system tables.

1. Impede caller if primary is empty.
2. Get from primary area only.
3. Get from secondary area if primary area is empty.

G.01.00  
13- 85Table Element Allocation (Cont.)

Request types 2 and 3 return an indication to the caller if the request could not be satisfied. The following table specifies the types of calls for element allocation and the action if an element is not activated.

BUFFER USER	CALL TYPE	FINAL ACTION
<b>SBUF's</b>		
File system	Impede	---
Ptape	Impede	---
Bad track	Primary	Forget request
<b>IOQ's</b>		
ATTACHIO (not impedeable)	Primary	Return IOQX-0
ATTACHIO (impedeable)	Impede	---
SIODH (memory management)	Secondary	Sudden death
IOMESSAGE	Secondary	I/O error

HEADER DEFINITION

Primary N	- Number of elements in the primary area.
Total N	- Total number of elements in the table.
Size	- Size in words of each element.
Impeded PCB	- If not zero then contains the PCB number of the first process waiting for an element in this table.
Head index	- Index of first free element.
Tail index	- Index of last free element.
In use	- Current number not in free list.
Overflows	- Number of requests made for an element.
Total requests	- Total number of elements requested.

## ICS Global Cells With Initial Values

STDB - absolute address of the currently running process's stack.  
 SBANK - bank address for process' stack.  
 S - stack DB relative S  
 DL - stack DB relative DL  
 Z - stack DB relative Z  
 PCBX - absolute stack address  
 XP - PCB table relative pointer to word D of the running process' PCB.

The above cells are to be initialized for the PROGENITOR.

CPCB - absolute 4, is an absolute version of XP. If CPCB is zero, then the above cells are invalid. This will never be the case in a process. CPCB should also be set by INITIAL.

SDST - DSTN for running process' stack.  
 JCUT - the bank zero absolute address of the JCUT table.  
 PADDR - PB relative address for the procedure PSEUDINT.  
 PSTA - status value for PSEUDINT, X140000+CSTN.  
 DISAP - PSDB counter, initially 0.

INITIAL sets the above as described.

G.01.00  
13- 90

## CS'80 Disc Interrupt Linkage Table (ILT)

There is one ILT for each device controller configured on the system. A controller may support more than one unit, however the CS'80 disc driver will only concern itself with the single unit controller.

## CHAPTER 14. SPDDLING

## Input Device Directory/Output Device Directory

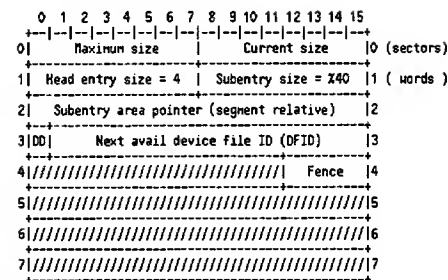

IDD/DDD (Common attributes referred to as XDD)

IDD: DST = 45 (= X55)  
SIR = 3DDD: DST = 46 (= X56)  
SIR = 4

## Overview of Table Structure

G.01.00  
14- 1

## Entry 0 (Overall Table Definitions)

DD: 0 ==> This is the IDD,  
1 ==> This is the DDD.

Fence: For spooled output devices (DDD), the system-wide out-fence. For spooled input devices (IDD), the jobfence.

G.01.00  
14- 2

## Typical Head Entry (4 words)

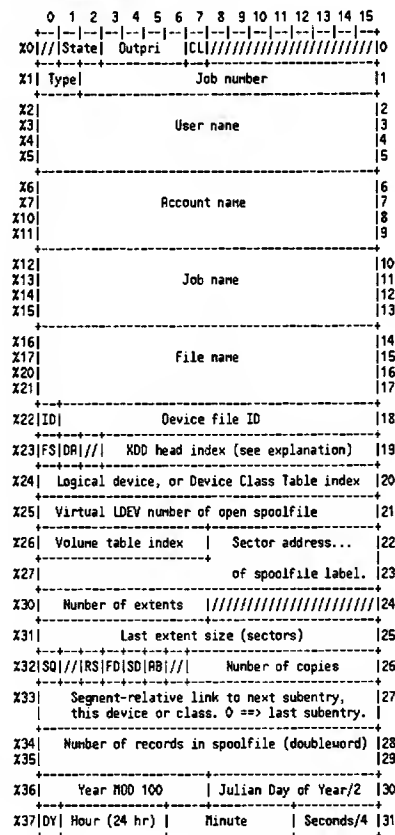

There are two types of head entry, a class entry and a logical device entry. There is only one class entry, and it is the first head entry in the DDD. The IDD does not have a class entry, and its position is filled with zeros. All spoolfiles opened by class (e.g., LP, SLOWLP, EPOC, PP, etc.) are linked to this entry. There is one logical device entry for each real (physical, as opposed to virtual) device on the system. Output devices appear in the DDD, input devices in the IDD. AC/DC devices such as terminals appear in both directories.

Each head entry is linked to 0 or more subentries (a typical subentry is shown in the next table). A null chain (0 subentries) consists of head pointer = 0 and tail pointer = segment-relative address of the associated head pointer. If one or more subentries exists, the pointers are segment-relative addresses of the first word of the first and last subentries of the chain. Any intermediate subentries are linked through the subentries. The tail subentry always contains a 0-link.

The Device Outfence and LDEV# fields are meaningless for the class entry. For logical device entries (non-0 Logical Device field), a non-0 Device Outfence means that this outfence overrides the system-wide outfence in word 4 of entry 0, but only for this device.

G.01.00  
14- 3

## Typical Subentry (X40 words)

G.01.00  
14- 4

Note: Words 0-X24 are used in all subentries. Words X25-X37, although present in all subentries, are zero unless the subentry is for a spooled file (spoolfile).

Word 0: State -- State of subentry:  
 0 == Active  
 1 == Ready  
 2 == Open  
 3 == Locked

CL -- 1 == Word X24 is a class index into the Device Class Table.  
 0 == Word X24 is the LDEV associated with this subentry.

Word 1: Type -- Describe which environment created the subentry:  
 0 == 'Seeslon' (SPOOK)  
 1 == Seeslon  
 2 == Job  
 3 == Job' (SPOOK)

Word X22: IO -- 1 == Output OFID  
 0 == Input DFIO

Word X23: FS -- There are one or more forms message requests in the spoolfile.  
 DR -- The spoolfile was created via a :DATA record (input spooling only).  
 Head -- The (segment-relative address)/4 of the head entry with which this subentry is linked. Since head entries are four words long, this can be thought of as an index into the head entry portion of the X00--If you disallow values of 0 and 1.  
 index

Word X24: -- See description of Word 0.

Word X25: VDEV -- LPDT index of virtual device LDEV. Simulates the properties of a real LDEV to the process which FOPEMs a new (previously non-existing) file (State field (X00(0), (1:2)) = 2 (Open)).

Word X26: VTINK -- The volume table index of the logical device in class SPOOL where the file label (first extent) of the spoolfile lives.

Word X32: SQ -- 1 == Squeeze (purge) spoolfile extents as the final copy is printed. Obsolete starting with C.00.20.  
 0 == Purge only when final copy printed.  
 RS -- 1 == Restart job when warmstarting (input spooling only).  
 FO -- 1 == There are non-standard forms on the device.  
 SO -- Spaced Out bit. File System could not acquire a new extent when creating spoolfile.  
 AB -- This is the \$STOLIST of an aborted job.  
 Words X36-37: -- Time stamp when spoolfile was made READY, or 00 if not closed properly. Julian day is 9 bits starting with Word X36, bit 8.

G.01.00  
 14- 5

### SPOOK Tape Format

The overall format of output tapes produced by the SPOOK "OUTPUT" command is shown below. The various components of the tape are then described in detail. The format described here is subject to change as MPE evolves. Also, there may be errors in SPOOK which would cause the actual tape format to differ from the one described here in some cases. All numeric information is in integer format unless otherwise specified.

EDF  
 EDF  
 Label Record  
 EDF  
 File Directory Records  
 Device and Class Directory Record  
 EDF  
 Spoolfile  
 EDF  
 Spoolfile  
 EDF  
 .....

Mechanisms for End-of-tape and tape switching are the same as for STORE/RESTORE tapes.

### Label Record

Words 0-13: "SPOOLFILETAPE LABEL-HP3000."  
 Word 23: reel number (first reel is number 1)  
 Word 24: date (from CALENDAR intrinsic)  
 Words 25&26: time (from CLOCK intrinsic)  
 Words 30&31: "HPEV" if an MPE V SPOK tape

G.01.00  
 14- 6

All other words are zero.

### File Directory

The File Directory has one entry for each spoolfile on the tape. Each entry is 12 words, and entries are packed into as many 1024 word records as needed. The last record will be padded with zeroes if necessary. The entry format is:

Word 0: Device file id number (bit 0 is on to indicate that the file is an output spoolfile)  
 Words 1-3: zero  
 Words 4-7: User name  
 Words 8-11: Account Name

### Device and Class Directory

The Device and Class Directory is contained in one 1024-word record. There is no EOF separating this record from the file Directory. This directory contains one entry for each logical device or device class linked to the spoolfiles on the tape. Also, there is an entry for each logical device in each class in the directory, whether or not that logical device was directly referenced by a spoolfile. The entries are packed into the tape record one after another in no particular order. The entry format is shown below.

### Logical Device Entry

Word 0: logical device number  
 Word 1: Bits 0:8 : device subtype  
 Bits 8:8 : 3 (=length of this entry in words)  
 Word 2: device type

G.01.00  
 14- 7

### Device Class Entry

Word 0: Device class number (negated). This is the number of the entry of this device class in the system's Device Class Table.  
 Word 1: Total number of words in this entry.  
 Words 2 on: The entire contents of the Device Class Table entry for this device class.

### Spoolfile Format

000 entry (32-word tape record)  
 Spoolfile block ---> Two spoolfile blocks packed into one  
 Spoolfile block 1024-word tape record.  
 Two spoolfile blocks  
 Two spoolfile blocks  
 .....

The first few spoolfile blocks have been modified to contain user label information from the spoolfile. This is explained later.

### Spoolfile Block Format

A spoolfile block is a 512-word block that contains variable length records in spooler format. Spoolfile records start at the first word of the block. The last record is followed by a -1 to indicate that no more records follow. The last two words of the block contain a doubleword which is the record number of the first record in the block.

### Spoolfile Record Format

Word 0: Byte count of record - 2  
 Word 1: Byte count of data portion of record. Note that this count includes trailing blanks. However, trailing blanks are truncated in

G.01.00  
 14- 8

the actual record, so this count may be more than the number of bytes actually present in the data portion.

Word 2: Function Code: 1=Fwrite  
2=Fcontrol  
3=Fopen  
4=Fclose  
X100 and beyond=FDEVICECONTROL

Word 3: P1 -- ATTACHIO parameter

Word 4: P2 -- ATTACHIO parameter

Word 5 on: Data Portion of Record

#### User Labels Information

Spoolfiles have a number of user labels with several kinds of information. These are:

1. Master: user label 0.
2. FOPEN entry catalog: user labels 1-10.
3. Circular queue for restart checkpointing: user labels 11-27.

Since older versions of MPE did not use user labels, a way was needed to incorporate them into the SPOOK tape format without losing forward and backward compatibility. The method used is to add several special spoolfile blocks to the beginning of the spoolfile on tape. Each of these blocks has exactly one FOPEN record at its beginning. This record is followed by a -1. Thus old versions of MPE will assume that the rest of the block is garbage. However, the rest of the block is actually used to contain user label information. The first two spoolfile blocks (i.e. the first tape record of the spoolfile proper) contain only the FOPEN records. The next 5 tape records actually contain user labels in addition to the FOPEN records. The user labels are packed 3 to a spoolfile block, 6 to a tape record. Each spoolfile block of 512 words has the following format:

Words 0-4: FOPEN record

Word 5: -1 (to "terminate" the block)

Words X200-X377: user label

Words X400-X577: user label

Words X600-X777: user label

G.01.00  
14- 9

Following this special group of blocks, the spoolfile resumes a normal format. The special FOPEN records all have the number of user labels in P2.

It is often the case that some of the 27 user labels have not been initialized before the tape is written. In that case, their places will be filled with garbage. There is no easy way of detecting this except by careful inspection.

G.01.00

## Message System General Description

The message system consists of the following parts:

- Callable intrinsic GENMESSAGE.
- Uncallable procedure GENMSG which is used by MPE.
- System message catalog (CATALOG.PUB.SYS) and any number of user catalogs.
- Program MAKECAT which builds message catalogs.
- MESSAGE SIR X24
- MESSAGE SYSGLDB CELLS X371-373
- MESSAGE ORTR SEGMENT

The message system is used by calling GENMESSAGE (or GENMSG) with a message number. The message system fetches the message from a message catalog, inserts parameters, then routes the message to a file or returns the message in a buffer to the caller.

A message catalog is a numbered editor-type file containing sets of messages. The sets serve to break a catalog into manageable portions. A message system user may call GENMESSAGE using either his own message catalog or using MPE's catalog (CATALOG.PUB.SYS).

After creating a message file, run the program MAKECAT in order to build a catalog that is readable by the message system. This file is still readable by the editor (it can be "texted") but it contains a directory (written as a userlabel).

In order to use the message catalog, the program must first open the message catalog, then call GENMESSAGE with the file number, set number and message number. (MPE users don't need to open the catalog, GENMSG automatically uses CATALOG.PUB.SYS.) The file must be opened with the options "NOBUF" and "MULTI" -record access.

G.01.00  
15- 2

## Message Catalog

Messages in the catalog can be of any length and can contain up to five parameters. Continuation of a message is indicated by "X" or "8" at the end of a line. The "X" symbol indicates that the message is continued and that a carriage return, line feed be issued the terminal. The "8" symbol indicates that the message is continued on the same line with no carriage return, line feed.

Parameters may be inserted into the message fetched from the catalog. The parameters are passed in the GENMESSAGE (or GENMSG) call and inserted wherever a "!" is found. For the system message catalog, the back slash (\) is also a parameter, reflecting a logical device number. The message is routed to the user associated with that logical device through the :ASSOCIATE command. Message sets are indicated by "\$SET n" starting in column 1 (the rest of the line is treated as a comment). Maximum value for n is 63. Comments can be inserted in the catalog by placing "\$" in column 1. Message numbers are positive integers, need not be contiguous, but must be in ascending order. After processing by the program MAKECAT, the catalog file contains records of 80 bytes, blocked 16, in 32 extents. (The system message catalog is only one extent, however). The format of the message catalog is as follows:

```
$SET 1 SYSTEM MESSAGES
1 LDEV #! IN USE BY FILE SYSTEM
2 LDEV #! IN USE BY DIAGNOSTICS
3 LDEV IN USE, DOWN PENDING
5 IS "!" ON LDEV#! (Y/N)?
.
.
$ MESSAGE 35 IS TWO LINES LONG, R PARAMETER STARTS THE

35 'X
MP32002B.00.
.
.
276 LDEV # FOR "!" ON ! (NUM)!
$
$SET 2 CIERROR MESSAGES
82 STREAM FACILITY NOT ENABLED: SEE OPERATOR. (CIERR 82)
200 MORE THAN 30 PARAMETERS TO BUILD COMMAND. (CIERR 200)
.
.
204 FILE COMMAND REQUIRES AT LEAST TWO PARAMETERS, INCLUDING
```

G.01.00  
15- 3

THE  
FORMAL NAME OF THE FILE (CIERR 204)

## MAKECAT Program

The program MAKECAT.PUB.SYS is used to build message catalogs (and also HELP catalogs). The program's input file has the formal designator INPUT, which must be used for all entry points. The program has the following entry points:

(no entry point) - Reads from input file and builds a temporary file (formal designator CATRLOG). Also renames any old temporary CATRLOG, CRTnn, using an archival numbering scheme (i.e., CRT1, CRT2, etc.).

BUILD - (Must log on under MANAGER.SYS.) Reads from input file, build the system message catalog (formal designator CATALOG), and installs the message system. Existing catalog is renamed CRTnnnn according to the same scheme as for no entry point (above). Installation of the message system means moving the directory contained in the userlabel of the catalog into a data segment. The DST number and the disc address of CATRLOG are placed in system global area. The message system may be installed while the system is running.

DIR - (Must have PM or DP capability.) Installs the system message catalog (does not build a new one). Opens input file, moves the directory in the CATRLOG into a data segment, and places the DST number and disc address of CATRLOG in system global area. This may be done when the message system seems to be "broken", but the catalog is intact. (MPE is issuing "MISSING MSG. SET=mm. MSG=mm" at terminals and at the console.) This may be done while the system is running.

HELP - Used to build the HELP catalog. Reads input file and builds a HELP catalog (formal designator HELPCAT).

## Field Definitions

BCOMIMAGE: Byte pointer to COMIMAGE (sometimes called WCOMIMAGE) in the CI stack.

COMMAND IMAGE: Command character string currently being executed.

LINELENSTACK: R CI command can span up to 30 input lines. This stack holds the length of each input line.

NEXTMSG: Used to be used to link messages together. No longer being used.

THIS IS SPARE: Not used.

UDC0: Holds the OST number of the UDC definitions.

UDC1: Holds the old S register value for UDC's.

UDC2: (0:1)--FLUSHUDC, used by :SETCTRLLOG

UDC3: (0:1)--OPTION LIST = 1  
(1:1)--OPTION LOGON = 1  
(2:1)--OPTION NOHELP = 1  
(3:1)--OPTION NOBREAK = 1

UDC4: (0:1)--UDC Fatal Ci Error  
(1:1)--UDC EXITBREAK  
(2:1)--UDC BREAKDETECTED  
(3:1)--UDC NOPRINT  
(4:1)--UDC INHGERDJUST  
(10:6)--UDC NESTLEVEL

IFNESTING: Level of nesting of :IF commands.

IFSKIP: Whether the current commands are being skipped as the false part of a :IF command.

ELSESEEN: Level of the :ELSE commands.

CIFLAGS: (13:1)--Sequenced: line numbers at rear.  
(15:1)--Not REDDable (last command).

CONTINUE STATE STACK: History of the :CONTINUE commands.  
= 0--no :CONTINUE  
= 1--just seen  
= 2--in effect.

PENDINGCOMLEN: If <> 0, command is already in stack and this word is the command string length.

BLASTCOMIMAGE: Byte pointer to last command image.

LAST COMMAND IMAGE: When a command completes execution, the command string is copied here for use by the :REDO command.

G.01.00  
15- 13Application Message Facility

The Application Message Facility consists of two parts: GENCAT, the catalog maintenance facility, and the "CAT" intrinsic, through which the message catalogs are accessed. The "compiled" catalog, which GENCAT creates, contains an extensive directory at the front of the file which describes where every message in the catalog is located. When a message catalog is opened (via CATOPEN) part of this directory is read into an extra data segment which is created specifically for that purpose. This "caching" of the directory provides nearly direct access to the desired message.

Three messages include message set number, message numbers, and record numbers placed or "cached" into 384 word message caches. The first set number and message number of each message cache is placed into a cache directory (set and message numbers must be ascending). A message is found by scanning first the cache directory, then the message cache searching for the desired set and message number. The retrieved message directory entry contains the record number in the catalog file of that message. Now, the catalog file can be read directly using the record number.

Internally, the two layer directory format is used by both the formatted application message catalog, and the message extra data segment created by the intrinsic CATOPEN (and used by CATREAD).

The catalog files created for MAKECAT and GENCAT may be used with the Application Message Facility. In most cases, applications will increase their performance in message routing and decrease the file space with formatted catalogs.

MLS Message Catalog/DST Overview

The maximum catalog size is 65536 sectors long. The largest set number is 255. The largest message number is 64766, while the smallest set and message number is 1.

G.01.00  
15- 14Formatted Catalog File Structure

REC# 0	OVERHEAD
REC# 1	CACHE DIRECTORY
REC# NC	MESSAGE CACHES
REC# D	DATA

where NC =  $2 + (2 * \text{Nmessage caches}) / 128$   
 D = NC +  $(384 * \text{Nmessage caches}) / 128$

Each physical record is one sector long (128 words). Each structure starts on a sector boundary.

G.01.00  
15- 15Cache Directory

Each entry in the cache directory is a two word entry. There exists one cache directory entry for each 384-word message cache. The first word of the cache directory entry is the set number of the first entry in the associated message cache. The second word of the cache directory entry is the message number of the first entry in the associated message cache.

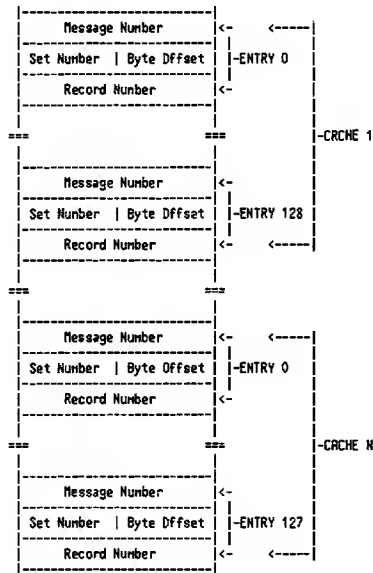

1st set number of cache 1	<-	-CACHE DIRECTORY ENTRY 1
1st msg number of cache 1	<-	
1st set number of cache 2	<-	-CACHE DIRECTORY ENTRY 2
1st msg number of cache 2	<-	
...		
1st set number of cache N	<-	-CACHE DIRECTORY ENTRY N
1st msg number of cache N	<-	

G.01.00  
15- 16

Message Cache Format

Each message cache is 384 words long (3 records). R message cache entry is 3 words long, 128 entries per message cache. Each entry contains the message number and set number of the message. The byte offset is the offset to the start of the message in the record specified by the record number. Entry 127 is a duplicate of the first entry in the next cache. This is to allow the total number of bytes of the message to be computed without reading the next message cache.

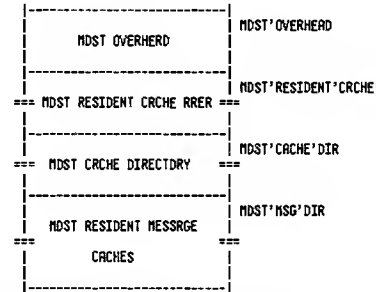

G.01.00  
15- 17

Data Format

The format of the messages is straight forward. It contains only the text of the message. It contains no comment records, message numbers or set numbers. All leading and trailing blanks are stripped from the message.

Message DST (MDST) Structure

An message extra data segment is allocated during a CRTOPEN. The data segment number is kept by the application on the return from CRTDPEN. The format of the data segment is similar of that of the formatted message catalog. The main difference is the addition of a table to track resident caches in the DST, and the catalog data is not kept in the DST.

Message DST Overview

NOTE: R resident cache is a message cache copied from the formatted catalog. Resident caches are swapped in and out of the MDST and are used to determine the record number of the desired set and message.

G.01.00  
15- 18

Message DST Overhead

0	"H"   "D"	MDST'ID
1	"S"   "T"	
2	Size of MDST ( in words )	MDST'SIZE
3	Catalog File Number	MDST'CAT'FNUM
4	Offset to Resident Cache	MDST'RESIDENT'CACHE
5	Offset to Cache Directory	MDST'CACHE'DIR
6	Offset to Msg directories	MDST'MSG'DIR
7	Cache Directory Size (uds)	MDST'CDIR'SIZE
8	Msg directory size (uds)	MDST'DIR'SIZE
9	Max num of resident cache	MDST'CACHE'MAX
10	Rechnum of first msg dir.	MDST'FIRSTDIR'RECHNUM
11	Reserved	
12	Reserved	

G.01.00  
15- 19

Message DST Resident Cache Rrea

The Resident Cache Rrea is a table of the message directory blocks currently stored in the MDST, together with their index. They are held in order from the most recently accessed at the top to the and the oldest on the bottom. The maximum number of caches held in the MDST at any one time is MDST'CACHE'MAX.

G.01.00  
15- 20

HOST Cache Directory

Each entry in the cache directory is a two word entry. There exists one cache directory entry for each 384 word message cache. The first word of the cache directory entry is the set number of the first entry in the associated message cache. The second word of the cache directory entry is the message number of the first entry in the associated message cache.

1st set number of cache 1	<-	
1st msg number of cache 1	<-	-CACHE DIRECTORY ENTRY 1
1st set number of cache 2	<-

Defdata Table Lookup File

This file contains the default information for MP-supported devices. This file, DEFDATA.PUB.SYS, is available to Syndump and Initial and eliminates the necessity for looking up default information every time a device is added to the system. Despite its name, DEFDATA.PUB.SYS is not only a file, but a table in the Coldload Information Table. It is not easily modified. Therefore, it is recommended that the file be left alone; if any user is unhappy with the defaults, they can be overridden during the Syndump or Initial dialogues.

## CHAPTER 17 MISCELLANEOUS

## Labeled Tape Subsystem

The MPE labeled tape subsystem permits convenient access to tapes labeled to either ANSI or IBM standards. It operates as a set of subprocedures to the file system. A labeled tape consists of one or more logical files. Each logical file consists of three physical files, i. e. tapes are delimited by tapemarks. The first physical file contains header labels, the second contains the data, and the third contains trailer labels which are (except for minor differences) copies of the header labels. The tapemark following trailer labels will be followed either by header labels for the next file, or by another tapemark if there is no next file. Labels are 80 bytes long, and conventionally are identified by their first four characters (three letters and a digit) and contain information as follows (CP := character position; L:= length):

VOL1: Present only on the first file of a volume, the volume label contains the volume identifier, which is usually the number on the tape strip, and is thus not expected to be changed.

CP	Field Name	L	Content
1/3	Label identifier	3	"VOL"
4	Label Number	1	"1"
5/10	Volume Identifier	6	Vol ID
11	Accessibility	1	"0" if IBM, else " "
12/79	Not used	62	Blanks
80	Label-Standard Version	1	"1" if NP ANSI else " "

UVLN: User volume labels. May be present on tapes from foreign shops, but are not written by MPE. If encountered, they are ignored.

G.01.00  
17- 1

HDR1: First header label. Required for each file. Specifies:

CP	Field Name	L	Content
1/3	Label identifier	3	"HDR"
4	Label Number	1	"1"
5/21	File Identifier	17	File name, if tape was not written by MPE, only the first eight are significant.
22/27	Volume Set Identifier	6	Name of the volume on which the set of files begins
28/31	Reel Number	4	Counts the reels that contain this file (1 starts)
32/35	File sequence number	4	Counts the files in the set of files (1 starts)
36/41	Not Used	6	MPE writes blanks
42/47	Creation Date	6	Year and day within year when the file was written.
48/53	Expiration Date	6	Year and day within year when the file may be overwritten without permission.
54	Accessibility	1	X230 if Lockword, "0" if IBM
55/60	Block count	6	Number of blocks if IBM.
61/73	System Code	13	"MP MPE 3000 "
74/80	Not Used	7	Blanks

G.01.00  
17- 2

## Labeled Tape Subsystem

NDR2: Second header label. Although defined by the standard, may be missing on foreign tapes. Contains:

CP	Field Name	L	Content
1/3	Label identifier	3	"HDR"
4	Label Number	1	"2"
5	Record Format	1	"F" = Fixed "V" = Variable "U" = Undefined Others treated as Undefined
6/10	Block Length	5	Block length (in character format).
11/15	Record Length	5	Record length (adhering to MPE rules) in characters.
16/23	Lockword	8	MPE File Lockword.
24/36	Not Used	13	MPE writes blanks
37	Record Type	1	"A" = ASCII "B" = Binary.
38	Carriage Control	1	"C" = control " " = no control.
39/80	Not Used	42	Blanks

G.01.00  
17- 3

## Labeled Tape Subsystem

IBM has a slightly different format. It is:

CP	Field Name	L	Content
1/3	Label identifier	3	"HDR"
4	Label Number	1	"2"
5	Record Format	1	"F" = Fixed "V" = Variable "U" = Undefined Others treated as Undefined
6/10	Block Length	5	Block length (in character format).
11/15	Record Length	5	Record length (adhering to MPE rules) in characters.
16	Not Used	1	Blank.
17	IBM Position	1	"0" = no volume switch "1" = a switch has occurred.
18/38	Not Used	11	Blanks.
39	IBM Block Attribute.	1	"B" = Blocked records. "S" = Spanned records. "R" = Blocked and Spanned. " " = No blocked or spanned.
40/80	Not Used	41	Blanks

G.01.00  
17- 4

User header labels: optional. Standard prescribes UMLn in the first four characters, but NPE doesn't care.

EDV1: End of Volume; used as first trailer label. Required if the logical file is continued onto another reel. Identical to HDR1, except contains the number of physical blocks of data in the data area.

CP	Field Name	L	Content
1/3	Label identifier	3	"EDV"
4	Label Number	1	"1"
5/54	Same as HDR1	50	
55/60	Block Count	6	Number of data blocks since last beginning of file section label group.
61/80	Same as HDR1	20	

EDV2: Defined by the standard, but may be missing on foreign tapes. Follows EDV1; format same as HDR2.

EOF1: End of File; used as first trailer label. Required if this is the end of the logical file. Format same as EDV1.

EOF2: Same as EDV2 except used after EOF1.

User trailer labels: optional. Standard prescribes UTLn in the first four characters, but NPE again doesn't care.

G.01.00  
17- 5

### Tape Label Table

The tape label table is the private playground of the tape label subsystem. It consists of two parts: LDEV Control Blocks (LCBs) and Volume Control Blocks (VCBs). The LDEV area is set up at system initialization and contains one entry for each magnetic tape LDEV and serial disc device in the system. As is common in NPE, the first entry is a dummy which tells where the other things in the table are. The volume area contains one entry for each labeled tape volume requested or active on the system.

Although table entries are stored in an extra data segment, they are generally manipulated via local copies on the stack. The procedures GETLDEV and GETFMUM look for LDEV and volume entries as specified; they copy them to stack buffers and return the DSI address for use in copying them back. POSTVTEXT copies the entries back, and in the case of a new volume entry, allocates space for it in the volume section of the tape label table.

Initial will build the "uninitialized" TLT as follows:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Size of the table, in words (always > 1)															0
Number of LDEVS in the table = X															1
flag=1															2
LDEVN															IT
Total of LDEVS (X) entries of above															
LDEVN															IT
Expansion area during SETUP TAPES															X*2

T: 1 if Tape drive 0 if not Tape drive (i.e. serial disc)

G.01.00  
17- 6

### Labeled Tape Subsystem

During PROGEN, SETUP TAPES is called to initialize the table. The overall structure of the initialized TLT is:

TLTOST -- X32,M26																TLTSIR -- X47,M39															
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15																
Table initialization word (=1 when initialized)																0															
Entry size (ESIZE) = X32,M26																1															
Table relative pointer to base of LCB entries (LTBRSE) (1)																2															
Table relative pointer to base of VCB entries (VTBRSE) (2)																3															
Table relative pointer to top of Volume table (VITOP) (3)																4															
Size of Tape Label Table, in words (VTNRN)																5															
																6															
																7															
																10															
not used																															
																30															
																31															
																32															
LDEV Control Block area -- one entry/nag tape drive																<-(1)															
																<-(2)															
Volume Control Block table -- contains VCB entries and free entries																															
																<-(3)															
Area available for expansion of VCB table																															

G.01.00  
17- 7

### Labeled Tape Subsystem

#### LCB Entry Format

The LCB entries have the following structure:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Type   T   L   B   NP															0
logical device number															1

															31

G.01.00  
17- 8

Type: 00 = no tape mounted  
 01 = unlabelled  
 10 = RNSI  
 11 = IBN  
 L: 1 if file has lockword.  
 T: 1 if device is a tape drive.  
 B: 1 if tape is from Burroughs, which has incorrect block/record size in the HOR2 label. Code can be patched to correct the size.  
 HP: 1 if tape is Hewlett-Packard RNSI format.

VCB address: Pointer to VCB entry describing volume mounted on tape drive, only if linked. Otherwise, 0.

G.01.00  
 17- 9

VCB Entry Format

The VCB format is:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

## Labeled Tape Subsystem

VCB (Cont.)

																26
																27
																30
																31

R: RSCII POSITION

F: Flush bit - operator did REPLY <pin>0.

O: DEVREC Wait (used with reelswitching).

Position: Gives head position within logical file.

0 = at load point (LDPNT)

1 = MOR1 label next (HINK)

3 = after MOR2 label (RH2)

4 = after user header labels (RNU)

6 = data next (ONX)

7 = after data (RD)

8 = EOF1/EOV1 label next (TINK)

10 = after EOF2/EOV2 label (RT2)

11 = after user trailer labels (RTU)

W: Write access specified.

SeqTyp: File open sequencing type.

0 = match filename

1 = NEXT

2 = RDOF

3 = use file sequence number

LblTyp: Rs in LCB entry.

L: Linkwait - mark left by CREATETLNT for LINKLABEL.

M: Mount wait - waiting for operator to mount tape on FOPEN.

R: Reelswitch wait - waiting for next reel.

B: Busy bit - this entry is in use.

LDEV #: Logical device number of tape drive with this volume, only if linked. Otherwise, 0.

S: STORE tape.

R: REELSITCH has been done. Used by STORE/RESTORE to handle STORE label and directory file.

D: Next file is directory. Used by STORE.

C: VOL1 label is to be created (written).

Density: volume set density. During a volume set open, contains the density requested by the user in FOPEN. Once the volume set is open, contains the actual density of the volume set. Only valid for tapes on variable density tape drives.

0 = default density for volume set open

1 = 1600 BPI

2 = 6250 BPI

V: 1 if volume set is being opened. Reset after completion of FOPEN.

G.01.00  
 17- 11

## Labeled Tape Subsystem

Volume Recognition

Volume recognition is the responsibility of DEVREC, which reads the first record of a newly-mounted tape on an unmounted drive and passes the record to AVREC. AVREC may see: VOL1 in the first 4 bytes, in RSCII, in which case the tape is RNSI; VOL1 in the first 4 bytes, in EBCDIC, in which case the tape is IBN; anything else, in which case the tape is considered unlabelled.

If the tape is unlabelled, AVREC reports to DEVREC that no further action is required. If the tape is labelled, AVREC wants to see the first MOR1 label, so asks DEVREC to read another record. (Unfortunately, DEVREC cannot be stopped long enough for AVREC to do its own read.) When the MOR1 record is found, the volume entries can be searched to see if there is a pending request for this volume. If so, the waiting process is restarted.

If the system has been restarted with tapes mounted, there will not be interrupts to alert DEVREC. The procedure RECOGNIZE is called when needed to see if any such tapes exist.

Opening a File

FOPEN gets into the tape label code in three different places. The first is to call CREATETLNT, which parses the string passed in the FORMMSG parameter to identify the labeled tape file required. If there is no existing corresponding entry in the volume area, this is a volume set open, and a new volume entry is created. There may be an existing entry (if the tape was FOPENed and FCLOSEd with disposition 2 or 3), in which case there is an associated LDEV entry for the drive on which the tape was left mounted by the prior operation; in this case, the new information is stuffed into the existing volume entry. A bit (LINKWRIT) is left set to mark the entry for LINKLABEL.

The second entry is through LINKLABEL, which is called from RLDCRTE. At this time, it is necessary to identify the LDEV to be used for the tape. If no LDEV is associated, the LDEV entries are searched to see if the operator has already mounted the required tape; if so, the volume and LDEV entries are cross-tied and LINKLABEL is done. If the search turns up nothing suitable, the operator is requested to mount the appropriate tape, and the procedure waits for either a REPLY or for AVREC to discover the appearance of a suitable tape and restart the process. If the operator enters a reply, it is validated.

The third entry is through POSITION, which is responsible for positioning the tape to the requested file. At the file, the MOR1 and MOR2 label are examined as required to determine the file characteristics.

Reading and Writing Files

All procedures which move tape go through the catchall procedure CNEKUL, which takes care of necessary labeled tape doings. The code insures that the sequence: header labels (including user labels), data, trailer labels

G.01.00  
 17- 12

(including user labels) is maintained. There is a separate CASE log for each such procedure.

If an EOT reflective mark or an EOF in data is found, REELSWITCH is called (principally from the file system procedure IONMOVE) to call for the next reel, if any. If another reel is needed, the tape drive is set Unmounted so that AVREC will be called to recognize the new tape when it is mounted. REELSWITCH returns to its caller when it is satisfied that an appropriate tape is mounted.

### Closing files

FCLOSE calls CHECKUL to handle writing EDF1 and EDF2 if needed and resolving the taps position. If the disposition is 3, the tape is left positioned at the next file. If the disposition is 2, the tape is supposed to be left at the beginning of the current file, but the code does not presently provide for reelswitching if the present file began on a prior reel.

At present, ensuing volumes of a multi-volume set must be mounted on the same drive as the first, mostly because neither the file system nor STORE-RESTORE was capable of dealing with LDEV changes in the middle of a file. REELSWITCH reports the LDEV being used, however, so that the capability of using a different LDEV can be added in the future.

### Store-Restore

Complications ensue on labeled STORE-RESTORE taps because there needs to be a file's directory at or near the beginning of each tap of a multi-volume sst; RESTORE uses this directory to determine whether the specified file(s) can exist on this tap. Because the real switching process would otherwise be invisible to STORE-RESTORE, special bits (VCB/ASHDME and VCB/WRITDIR) are kept to enable special intrinsics callable by STORE-RESTORE to report whether a directory needs to be written or is about to be encountered.

The special procedure MEXTRPEFILE is used by STORE-RESTORE in lieu of doing a FCLOSE(3) followed by an FOPEN to get to the next file. This permits cleaner handling of both REPLY 0 and Forward Space (logical) files over a Reelswitch, as well as saving the time needed to tear down and reconstruct all the control blocks.

### Miscellaneous

PVOLID is used by the SHOWDEV command processor (in SPDDLCOMS) to obtain the name of the volume on the specified drive without having to know the structure of the tape label table. For the same reason, TGETINFO is used by the FFILEINFO intrinsic (in FILEIO) to get labeled tape information.

System failure 86 in MPE is defined as a major problem in LABSEG. Generally speaking it is a problem with the TLT setup, for example if LABSEG cannot find an LDEV in the table.

G.01.00  
17- 13

### Breakpoint Table

OST = 30(10) = Z36

The break point table is divided into 2 sections:

- 1) PCB BREAKPOINT EXTENSION TABLE (PCB'BKPT'EXT)  
This table contains the heads of the breakpoint chains
- 2) BREAKPOINT ENTRY TABLE (BKPT'ENTRY'TAB)  
This table contains the actual entries

## Timer Request List (TRL)

The system clock interrupts every 100 ns, with the CR being automatically cleared. An exception is the Shared Clock Interface measurement service which allows rates as fast as 5 ns. The interrupt handler in the procedure TICK. On entry, OB is pointing to the base of timer request list. Besides timeout requests, the clock also controls time slicing.

ENT0	0	NUMBER OF ENTRIES

6	OITP	LP not ready
7	OITP	2540
X10	Port mask	Msg port timeout
X11	OITP	Block node read timeout (30 secs)
X12	PCBB index to process	Watchdog timer for process

The list of pending requests is kept ordered by time with later entries at the tail.

X20-X37	OITP	SIO device timeout: OIT8. (code 1 on expiration, cleared on timereq.
X5/X6	*DTIME	For Series 30/33, DTIME is # of TICS (0.081457 ns) since last midnight.

G.01.00  
17- 20

### MPE User Logging

MPE USER LOGGING enables users and subsystems to log changes to data sets on disc or serial files. This "change" file can later be used to recover data lost due to a system or program failure. The log file can itself be used for auditing purposes.

### General Design Overview

#### Hardware Environment

No special hardware is required to operate the system. However, if logging to a tape file is desired, the hardware configuration must include a tape drive. If there is no tape drive, then may log to a serial disc class device.

#### Software Environment

MPE User Logging is an integral part of MPE. No other special software is required.

#### Design Narrative

User Logging enables users and subsystems to journalize additions and modifications to MPE and subsystem files. The journal can reside on either disc or serial logfiles.

User Logging consists of a logging process, a memory buffer, a disc resident logging buffer (for serial logging) and a user defined destination log file on disc or serial media.

The logging process has two functions depending on whether the destination file resides on disc or serial media. If the destination file is serial, the logging process performs all output to the destination file. If the destination file is on disc, the logging process allocates additional space (extents) as it is required by the user.

The logging buffer is divided into communication and buffer areas. The communication area is used to pass information among the users and the logging process. This information includes status of the logging process and logging file, space remaining in the logging file and error information important to users or the logging process. The buffer portion of the logging data segment blocks input into the logging file before the data is actually posted. The buffer is flushed any time a user requests to close a log file or when a logging process is terminated. (The buffer is also flushed by the begin/end transaction or buffer flush requests).

G.01.00  
17- 21

### User Logging Table

#### Design Structures

#### User Logging Table

ENTRY SIZE = #38 words  
DST X33

Table containing an entry for each activated user logging process. Each entry is created when the process is started, and deleted when the process terminates. (Via :LOG command). The information is extracted from the Logging Identifier Table (LIDTAB).

#	ENTRY D	X
0	NUMBER OF ENTRIES	0
1	FREE ENTRY HEAD PT.	1
2	INUSE ENTRY HEAD PT.	2

NUMENTRIES = LOGTAB  
FREE = LOGTAB(1)  
INUSE = LOGTAB(2)  
BUFNUM = LOGTAB(3)  
MAXLOGPROC = LOGTAB(4)  
MAX'USR'PROC = LOGTAB(5)  
LOGTAB'ESIZE = LOGTAB(7)

G.01.00  
17- 23

### Error Recovery Description

The error recovery mechanisms provided by User Logging are: power fail recovery and recovery from system failure.

Power failure recovery applies only to tape log files since MPE provides adequate recovery for disc files during power fail. When a power failure is detected, a message will be printed on the console asking the operator to place the tape drive back on-line. (If the operator places the tape on-line before the message valid data may be overwritten). (To reset the tape drive the operator must hit the load button until the tension returns to the drive. Then hit the reset button followed by placing the tape drive back on-line). At this time the log process will recover the file by rewinding to the load point and then forward spacing to the point where the power fail occurred. Writing to the log file will continue at that point.

In the event of a system failure, the warm start load option initiates recovery of User Logging files. In the case of a serial file, the file is read and compared to the disc logging buffer. All records found in the disc buffer that are not on the serial log file are posted and a proper end of file written. If the destination file is a disc file, all records are read and verified and an end of file posted to the file. In order to continue logging to a User Logging file that has been recovered in this manner, the logging process for the file must be restarted using the console command :LOG.

#### NOTE:

Any records in the buffer area of the logging buffer will be lost.

User logging has been enhanced to work with labeled serial discs. Internally the log process handles serial disc (or cartridge tape) log files the same as for tape files.

G.01.00  
17- 22

### User Logging Table

#### NUMENTRIES

The number of entries in the logging table.

#### FREE

R table relative pointer to the first free entry in the logging table. (-1 = table full).

#### INUSE

R table relative pointer to the first entry in the logging table that is being used (-1 = no entries in use).

#### BUFNUM

The number of the buffer associated with this logging process. Used to create the name of buffer file if serial logfiles. (i.e. ULGXXXX.PUB.SYS).

#### MAXLOGPROC

The maximum number of user logging processes allowed.

#### MAX'USR'PROC

The maximum number of users per logging process.

#### LOGTAB'ESIZE

The size (in words) of each entry in the table.

G.01.00

G.01.00  
17- 26

User Logging Table

**LGNAME**  
The name of the logging process (logging identifier).

**BNAME**  
The name of the disc buffer used if the logging process destination file is a serial file. This is a file that resides in PUB.SYS. The format of the name is ULGxxxx where xxxx is the buffer number padded on the left with zeroes.

If the switch flag is true, the following will be the fully qualified file name of the new log file.

**LFNAME**  
The name of the logging file.

**LFLOCKW**  
The lockword of the disc logging file.

**LFGROUP**  
The group that the destination logging file resides in if the file is a disc file.

**LFACT**  
The account that the destination logging file resides in if the file is a disc file.

**NUMUSERS**  
The number of users currently accessing the logging file.

**DST**  
The dst number of the logging data segment (LOGBUFF). (-1 = LOGBUFF not created yet)

**STATUS**  
The status of the logging process.  
INITIALIZING = -1  
INACT = 0  
ACT = 1  
RECOVERING = 2

**LGAUTO**  
True if the automatic changelog facility was enabled. (Not used - for future use).

**LGTYPE**  
The type of destination file of the logging process.  
DISC = 0  
TAPE = 1  
SOISC = 2  
CTAPE = 3

**LGDEV**  
The logical device number of the disc logging file or the disc logging buffer.

**PIN**

G.01.00  
17- 27

User Logging Table

The PCB number for the logging process (PIN \* PCBSIZE).

**LGSWITCH**  
Flag indicating a CHANGELOG is pending (if true). (Not used - for future use).

**LGNEW AUTO**  
True if the automatic changelog facility was requested for the new log file. (Not used - for future use).

**LGNEW TYPE**  
If a switch is pending, this will be the type of the new log process. (-1 = no switch pending). (Not used - for future use).

**LGADDR**  
Sector number of the current extent in the disc logging file or the disc buffer file. (Disc buffer file has only 1 extent)

**BSIZE**  
The number of records in the current extent (for disc logging) or the number available in the disc logging buffer.

**NEXT**  
A table relative pointer to the next entry in the logging table. (-1 = this is last entry)

**PREV**  
A table relative pointer to the previous entry in the logging table. (-1 = this is first entry)

G.01.00  
17- 28

There will be one of these tables around for the life of any active user logging process. The table consists of three parts:

USER ENTRIES - Information for a specific user of the process. One of these for every user of a process (Setup by OPENLOG, released by CLOSELOG).

**BUFFER AREA** - Buffer used to hold logging records from all users before writing to the log File.

## User Logging Buffer

## LOGID

The name of the logging process.

## SWITCH

True if log file switch is pending. (Not used - for future use).

## NEWUTO

True if the automatic changelog option has been specified for the new log file. (Not used - for future use).

## NEUTYPE

If a switch was requested, this will be the type of the new logging file. (-1 = no switch pending) (Not used - for future use).

## AUTO

True if the automatic changelog option was specified for the current log file. (Not used - for future use).

## LOGTYPE

The type of destination file for the logging process.

DISC = 0  
TAPE = 1  
SDISC = 2  
CTAPE = 3

## BDST

The data segment number of this table.

## LOGPIN

This is the PCB number for the logging process (PIN\*PCBSIZE).

## NUMUSER

The number of users currently accessing the logging file.

## MAXUSER

The maximum number of users allowed to access the logging file.

## USERNO

The next sequential number to be assigned users accessing the system. It will get incremented for every unique OPENLOG - used as the log # in the logging record format.

## SLPCT

The number of users currently waiting for activation by the logging process.

## STATE

The state of the user logging process.

INACTIVE = 0  
ACTIVE = 1

## MSG

An internal message word used to indicate an error or operator request.

6 - Continue processing, all is fine.  
2 - Suspend - error reading buffer file or writing to serial file  
3 - Stop - set when issue :LDG logid,STOP or when an EDF condition is found on the disc log file.

G.01.00  
17- 33

## User Logging Buffer

## LOGMSG

A messages from the logging process.

6 - Continue processing, all is fine.  
15 - EDF - if there are no more extents available to be allocated.  
12 - Disc space - could not allocate the new extent because no space left in the group.  
9 - Write error - error occurred while writing to log file

## USERMSG

A messages from the user process.

6 - Continue processing, all is fine.  
12 - Disc space - user process needs another extent allocated for disc logging.

## LOGERR

Last error found. After changelog:

+M - File System error number encountered  
0 - No error  
-1 - New disc log file was not empty  
-2 - New disc log file did not have file code LOG  
-3 - New disc file is too small  
(Not used - for future use).

## LOGDEV

The logical device number of the current extent of the disc log file or the disc buffer file (buffer file has only 1 extent).

## BSPACE

The amount of space, in records, that are currently available to the users. On the last block of the last extent, one record will be saved by the logging process so that the proper close information can be posted to the file - either the trailer record (if the log logging process is stopped) or the change to new record because of an EDF condition (and the AUTO option had been specified).

## BUFUSED

The number of records currently in the buffer. On all extents, except the last extent BUFSPACE+BUFUSED = 32 (number of records in a complete block). However, on the last block of the last extent this will NOT be true since one record is always held in reserve by the logging process.

## VSETNO

This shows the order in the log file "set" of the currently opened log file. (Not used - for future use).

## LOGADDR

The disc address of the current extent of the disc log file. If it's a serial file, this is the disc address of the disc buffer for the file.

## INBUFAEC

The record number of the next block to be written to the logging destination file or the disc logging buffer for serial files. (Used as an offset into the current extent for the writes - since each record is one sector in length).

G.01.00  
17- 34

## User Logging Buffer

## FSIZE

The current extent size of the logging destination file or disc logging buffer file for serial destination files. (on the last extent this will be the last extent size minus 1).

## FSPACE

The space in records that remains in the current extent of the disc logging destination file or disc buffer for tape destination files. (On the last extent of the disc log file, this is the amount of space minus 1).

## TRECS

The total number of records written to the logging destination file (including those records currently in the buffer).

## MAXFSPACE

The total file size, in records, minus 1. (Need that last record to post close information).

## LASTEXT

The extent number of the final extent in the disc logging file or disc buffer file.

## EXTENT

The current extent number of the disc logging file or disc logging buffer.

## RESOURCE

Used for resource management (i.e. locking the LOGBUFF). Format is:

RESOURCE + 0 = Owner PCB number  
RESOURCE + 1 = Head of impeded queue PCB number  
RESOURCE + 2 = Tail of impeded queue PCB number  
RESOURCE + 3 = Queue length

## UHEAD

A table relative pointer to the first entry into the logging data segment. (-1 = no entries currently in use)

## FHEAD

A table relative pointer to the first free entry in the logging data segment. (-1 = no free entries)

G.01.00  
17- 35

## User Logging Buffer

TYPICAL LOGBUFF ENTRY

 RCCT = BINDEX+16

UPIN = INDEX+12  
 OPENCNT = INDEX+13  
 USTATE = INDEX+14  
 ERROR = INDEX+15  
 LGNUM = INDEX+16  
 SCODE = INDEX+17

RECS = DINDEX+9

NENTRY = INDEX+23  
 PENTRY = INDEX+24

## USER

The name of the user who opened the logging file through this entry.

## GROUP

The group of the user who opened the logging file.

## RCCT

The account of the user who opened the logging file.

## UPIN

The PCB number of the user process (PIN \* PCBSIZE).

## OPENCNT

Counter of how many times this user called OPENLOG. (Incremented for every OPENLOG, decremented for every CLOSELOG). (Not used - for future use).

## USTATE

The wait status of the users process.

INACTIVE = 0  
 ACTIVE = 1

## ERROR

Used to hold error information for this user.

-1 = No room in disc (or disc buffer) and NOWAIT.  
 0 = O.K.

## LGNUM

The logging number assigned to the user. (From USERNO in global area to be used as log # in the log record).

## SCODE

The subsystem code for the caller. This applies only to privileged callers.

## RECS

The number of records written by this user.

G.01.00  
 17- 37

## User Logging Buffer

## NENTRY

A table relative pointer to the next entry in the logging data segment. (-1 = this is the last entry)

## PENRY

A table relative pointer to the previous entry in the logging data segment. (-1 = this is the first entry)

G.01.00  
 17- 38

## Logging Identifier Table

## User Logging Identifier Table

ENTRY SIZE = #33 words  
 OST X41

Table containing an entry for each potential logging process. Entries are added via :GETLOG and released via :RELLOG.

## Entry #0

28			34
		USER'S RCCOUNT	
32			40
		LOG TYPE	

## BYTE ENTRIES

LID = BLIOTRB  
 PW = BLIOTRB(8)  
 FNRME = BLIOTRB(16)  
 LW = BLIOTRB(24)  
 FGROU = BLIOTRB(32)  
 FRCT = BLIOTRB(40)  
 UMRME = BLIOTRB(48)  
 URCT = BLIOTRB(56)

## WORD ENTRIES

TYP = LIOTRB(32)

LID  
The logging identifier name. This is a maximum of eight characters long.

PW  
The pass word for the logging identifier. This is a maximum of eight characters long.

The following is the fully qualified file name of the current log file.

FNRME  
The name of the destination file.

LW  
The lock word on the destination file if the file is on disc.

FGROUP

G.01.00  
17- 41

# Logging Identifier Table

The group that the file resides in.

FRCT  
The account that the destination file resides in.

UMRME  
The name of the user who created the logging identifier.

URCT  
The account of the user who created the logging identifier.

TYP  
The status of the entry. -1 = null entry  
0 = disc logging file  
1 = tape logging file  
2 = serial disc logging file  
3 = cartridge tape logging file

G.01.00  
17- 42

## User Logging Record Formats

### Logging Record Format

RECORD SIZE = 128 words  
 USER RRER = 119 words

### LOG RECORD RT OPENLOG

0	2	3	4	6	7	11	12		24	25	127
rec#	cksun	code	time	date	logid	log#	creator	pcb			

### USER OR SUBSYSTEM/CONTINUATION LOG RECORD (from WRITELOG)

0	2	3	4	6	7	8	9				127
rec#	cksun	code	time	date	log#	len			user area		

### LOG RECORD RT CLOSELOG

0	2	3	4	6	7	11	12		24	25	127
rec#	cksun	code	time	date	logid	log#	creator	pcb			

### CRASH MARKER

0	2	3	4	6	7						127
rec#	cksun	code	time	date							

### HEADER RECORD (START/RESTART)

0	2	3	4	6	7	11					127
rec#	cksun	code	time	date	logid						

G.01.00  
17- 43

## User Logging Record Formats

### TRAILER RECORD (STOP)

0	2	3	4	6	7	11					127
rec#	cksun	code	time	date	logid						

### NULL RECORD

0	2	3	4	6	7						127
rec#	cksun	code	time	date							

### BEGIN TRANSACTION MARKER

0	2	3	4	6	7	8	9				127
rec#	cksun	code	time	date	log#	len			user area		

### END TRANSACTION MARKER

0	2	3	4	6	7	8	9				127
rec#	cksun	code	time	date	log#	len			user area		

## CODE DEFINITION

CODE (8:8) =  
 1 Open log record  
 2 User/subsystem record (writellog)  
 3 Close log record  
 4 Header record  
 5 Trailer record  
 6 Restart record  
 7 Continuation of a user or subsystem record  
 8 Crash marker  
 9 End transaction record  
 10 Begin transaction record  
 11 SPRCE NULL record

G.01.00  
17- 44

## DATA FIELDS OF LOG RECORDS

```

RECN      = DOUBLE INTEGER
CKSUM     = INTEGER
CODE      = INTEGER
TIME      = DOUBLE (from intrinsic CLOCK)
DATE      = INTEGER (from intrinsic CALENDAR)
LOGID     = ASCII
LOGN      = INTEGER
LEN       = INTEGER
USERAREA  = ASCII
CREATOR   = ASCII
PCB       = INTEGER

```

## NOTE:

1. The checksum algorithm uses the exclusive or (XOR) function against a base of negative one.
2. Null record is used for filler.
3. The code word of the logging record can contain a subsystem code defined by the user in the first half of the word (0:8). User logging allows privileged users to pass this code in the index parameter of the Openlog intrinsic.
4. The "len" field will contain the entire length of the data in the transaction (i.e. the length passed to WRITELOG, BEGINLOG, ENDLOG). If a continuation record is part of the transaction, it will also contain the entire length of the data. For example, a length of 140 was passed to the intrinsic. The "len" field of the first record will be 140, the "len" field of its continuation record will also be 140 - even though the actual amount of data found in the first record will be 119 and the data found in the continuation record will be 21.  
(Positive length = N words, negative length = N bytes)

G.01.00  
17- 45

## CHAPTER 18 MESSAGE FILES

## Message File Data Structures

This chapter contains the data structures necessary to support message files. The first section details the message file's version of the familiar file system data structure; i.e., the file label, file control block, access control block, etc..

The second section shows the tables used by the basic IPC mechanism which is a set of internal, MPE procedures designed to support the "boundary conditions" of IPC files. For example, signaling a no wait reader that its record has arrived. See the section's introduction for a detailed description.

## File Structure

## File Label/FCB Extent Map

	End of file block	Start of file block
Disc addr of extent 0	.	.
Disc addr of extent 1	v	.
Disc addr of extent 2	-	.
Disc addr of extent 3	.	.
Disc addr of extent n-1	.	v
Disc addr of extent n	.	-

The EDF and SDF are examples only, meant to show:

- 1) The start of file moves into the extent map as records are read
- 2) The file can wrap around and, hence, cause the SDF to be greater than the EDF.

When a file becomes empty the SDF and EDF are reset to the first block of extent zero.

Each extent is composed of a number of blocks. Extents all have the same number of blocks. Extent zero also contains space for the file label and user labels in the exact same format as standard files. Starting with block zero, sufficient blocks are allocated to the file label/user labels to satisfy their space requirements.

Extents outside of the SDF/EDF range may not exist. They are deleted at close time when there are no more writers accessing the file.

G.01.00  
18- 1

## Block Structure

First data record	*****
Second data record	Exact same format as standard variable length blocks.
Last data record	
Record delimiter (-1)	*****
Empty space (next record would not fit)	
Header delimiter (Z77)	
Last header record	
Second header record	
First header record	

Separating the data portion of the records from their header enables the standard file system access procedures to read the records with no knowledge that they are msg file records.

## Record Format

Number of bytes in record
First data word of record
Last data word of record

Length word's value does not include itself.

G.01.00  
18- 2

## Header Format

C LC	Header Type 0
Writer's ID	-1

C (0:1) - Set on if this was the last record written before the system crashed. This bit is set on by the first open on the file after the crash.

LC (1:1)- Valid only for close headers. Set to one if this is the last writer to close the file.

Type(B:8)- 0 data  
1 open  
2 close

## Message Access Control Block

## Notes:

1. Words/fields that do not pertain to message files are left blank.
2. This diagram shows the "combined" ACB as it appears to the message access procedures (the procedures in IPC). Thus it is a combination of the LACB and the PACB.

-5	DST number of the PACB	-5
-4	PACB control block vector table address	-4
-3	DST number of the LACB	-3

G.01.00  
18- 7

## Word Field Description

66	Accessor's local flags.
(0:1)	D 1 - have not yet issued an FREAD/FWRITE against the file.
(1:1)	ex 1 - extended wait node.
(2:1)	nd 1 - do not destroy the next record read.
(3:1)	vr 1 - writer has not yet written his first record (ie., he is a virgin).
(4:1)	bt 0 - transmission log should be expressed in words.
1 -	" " " " " bytes.
(5:1)	cle - Not currently used (reserved for group IPC standard).
(6:1)	C - No wait completion message is in LACB area.
(8:8)	car ctl- carriage control character to be used for the writer's record (a value of one indicates no carriage control character).
40	File's global flags.
(1:4)	- number of read buffers
(5:4)	- number of write buffers
(9:1)	er 1 - extended read
(10:1)	qu 1 - one or more writers has been queued on the wait queue.
(11:1)	n 1 - wait msg is located in the ACB
(12:1)	c 1 - completion msg is located in the ACB
(13:1)	d 1 - the current write buffer has dirty bit set
(14:1)	e 1 - the start of file is block zero
(15:1)	f 0 - the ACB buffers have not been filled

G.01.00  
18- 8

MMSTAT Definitions

Octal Value	Event Type	Parameter 1	Parameter 2

73/1	Delete rec	(0:8) error, (8:8) ID	(0:3) rec type (3:13) number of records
73/2	Delete blk	Start of file block #	End of file block #

## Notes:

1. The aa/bb notation in the "octal value" column denotes type/subtype. Type is the actual MMSTAT event number. Subtype is (0:4) of parameter 0.

2. Several items can possibly exceed their fields, in that case the bits beyond the field are lost. These items are number of records, number of free records, start of file, and end of file.

G.01.00  
18- 9

3. Parameter word zero has a common format for all the MMSTAT events.

Field	Description
(0:4)	Event's subtype.
(4:2)	File's state 0 - empty 1 - partially full 2 - only a fraction of a free record is left 3 - completely full
(6:1)	Nonzero indicates that there is one or more waiting readers.
(7:1)	Nonzero indicates that there is one or more waiting writers.
(11:1)	Nonzero indicates that the write has a carriage control character.
(12:4)	Flags local to the accessor. (12:1) - the accessor has done no FREADS/FWRITES (13:1) - extended wait (14:1) - nondestructive read (15:1) - writer has not written any records

G.01.00  
18- 10

File System Basic IPC Definitions

The objective of this set of uncallable procedures is to provide a simple ipc mechanism to support the ipc file access procedures. It enables one process to send short, control messages to another process.

General BehaviorFCPORTOPEN Procedure

The heart of this mechanism is the port. A process desiring to receive messages would first open (create) a port. This process is termed the "port manager." When the port is created, a port number is returned to the opener. Since the port number value cannot be known in advance, potential senders need some method of obtaining the port number from the port manager.

Both the ports and the messages are contained in a single disc resident data segment. There can be a total of over thirty-five hundred open ports and outstanding messages. Thus neither ports nor message blocks are scarce resources.

FCPORTSEND Procedure

This procedure sends a 0 to 5 word message to a port. Optionally a timeout value may be specified which will limit the duration the message will remain attached to the port. Expiration of the timeout causes the message to be deleted from the target port's queue and placed on the sender's reply port (specified by the sender in the FCPORTSEND procedure call).

FCPORTRECEIVE

Reads and deletes the head message from a port. The sender's return port number is also given to the receiver, enabling him to send a reply message.

FCPORTCLOSE

Demolishes the port.

IPC file's use of this mechanism

All open message files have two ports open for the file (read wait queue and write wait queue), plus one port per accessor (reply port). Their use is described in the following.

G.01.00  
18- 11

Reader and writer wait queues

When an empty message file is accessed by more than one reader (share), then there must be a way of having the readers' FRERDs satisfied in the same order that they were issued. That is, there must be queue of waiting readers. The ipc access procedures accomplish this by dedicating a basic ipc port as a "read wait queue." Whenever a reader's request is stalled because the file is empty, a message is sent to the read wait queue. Subsequent FRERDs by other processes will queue up behind the first reader in a FIFO manner. An FWRITE will take the first entry from the wait queue and send a "read may be done" message to the reader's reply port.

In a like manner multiple writers will queue on the write wait queue when the file is full.

Completion notification for nowait I/O

The IDWAIT intrinsic waits for a message to be sent to the reply port (s) of the specified user files.

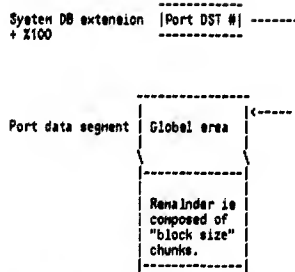

Timeout

When an accessor encounters a boundary condition (ex, a reader accesses an empty file), it may specify that the condition must be satisfied in x seconds (FCCTRL 4). To this end the ipc access procedures merely issue the FCPORTSEND to the wait queue with the user's timeout value specified. The timeout will tear the message from the wait queue and place it on the accessor's reply port.

 18- 18

CHAPTER 19 MPE MEMORY RESIDENT MESSAGE FACILITYOverview of Facility

The memory resident message facility of MPE V addresses the need for an efficient, simple, and uniform method for system code to send short status-type messages to processes.

Each process is created with a "port" in the message harbor table (DST X71) which supports a set of message subqueues which are private to that process. There is a maximum of four subqueues per port in the initial implementation. This limit can be easily extended when new subqueues are required.

Any system code, even code running on the ICS, can send a message to any subqueue of any process. The destination process' PIN must be known, any a priori conventions on subqueue number and message format must be established. The caller of SENDMSG may optionally specify that the destination process be awakened from a message wait.

Message can be any length up to the configured maximum. Message length is specified in the call to SENDMSG and RECEIVMSG. In the initial implementation, messages are limited to 6 words in length with 4 words available for data. This maximum can easily be increased if the need arises.

By calling PORTSTATUS, a process may at any time determine whether a specified subqueue is non-empty or obtain the subqueue number of the most urgent non-empty subqueue (lowest numbered one).

By calling RECEIVMSG, a process may receive the message at the head of the specified subqueue. This receive is optionally non-destructive.

A process can wait on a message wait, or on a combination of message wait and other wait types.

Message IntrinsicSENDMSG

```

Procedure SENDMSG(Destpin, Subqueue, MsgLength, Flags);
Value            Destpin, Subqueue, MsgLength, Flags;
Integer          Destpin, Subqueue, MsgLength;
Logical          Flags;
Option Privileged, Uncallible;

```

Destpin, Subqueue, and MsgLength have to be within range or a System Failure 622 will occur.

The caller of SENDMSG stacks the message contents before calling the procedure. SENDMSG expects the first msg word to be at Q-7-MsgLength, and the last msg word at Q-8. The message contents at Q-8 to Q-7-MsgLength are deleted from the top of stack by the exit from SENDMSG to the caller.

G.01.00  
19- 1

Flags.(1:1) = 1 ==> Wake-up destination process from a message wait.

Return CC = CCG if process was already awake else CC = CCE.

PORTSTATUS

```

Logical Procedure PORTSTATUS(Subqueue);
Value            Subqueue;
Integer          Subqueue;
Option Privileged, Uncallible;

```

When supplied a valid subqueue number, PORTSTATUS returns a true value if the subqueue is non-empty and a false value if the subqueue is empty.

When passed a -1 as subqueue parameter, PORTSTATUS returns the subqueue number of the process' most urgent non-empty subqueue (the smaller the number, the more urgent the subqueue).

If all subqueues are empty, PORTSTATUS returns CC = CCE. If at least one subqueue is non-empty, PORTSTATUS returns CC = CCG.

RECEIVMSG

```

Procedure RECEIVMSG(Subqueue, MsgLength, Flags);
Value            Subqueue, MsgLength, Flags;
Integer          Subqueue, MsgLength;
Logical          Flags;
Option Privileged, Uncallible;

```

Subqueue and MsgLength has better be within range or a System Failure 622 will occur.

The caller of RECEIVMSG does an ASSEMBLE(ADD5 MsgLength) to make space for the message contents. RECEIVMSG stores the message contents into Q-8, Q-9, ..., Q-7-MsgLength. Q-7-MsgLength contains the first word of the message.

Flags.(0:1) ==> do not release message from head of subqueue (non-destructive read).

Return CC = CCG if all subqueues were empty, else CC = CCE.

```

| 0| 1| 2| 3| 4| 5| 6|
+-----+
|LS| L| DATA | LS = Subqueue or Link
+-----+ L = Length (2-6)

Event 13 (Z15)

EVENT NAME: DEALLOCM  
 DESCRIPTION: RELEASE REGION OF MEMORY TO AVAILABLE STATUS

CALLING MODULE: KERNELC  
 CALLING PROCEDURE: RELEASEREGION

PARAMETER DESCRIPTION

P1 = SIZE RELEASED IN PAGES  
 P2 = BANK OF RELEASED REGION BASE  
 P3 = ADDRESS OF RELEASED REGION BASE  
 P4,P5,P6 - Unused.

G.01.00  
 20- 11

Event 14 (Z16)

Event Name: CACMEMOV  
 Description: A cache move (i.e. logical disc request) has just completed.

Calling Module: CACHESEG  
 Calling Procedure: ProcessCDTLogReqQue

Parameter Description

P1,P2 = Segment identifier of target DST (LDR'BUFST)  
 P2.(0:1) = 1 then this is a stack.  
 P3 = Mapped Domain CDT entry number  
 P4 = Transfer count  
 P5,P6 = Unused

Event 15 (Z17)

Event Name: GET CDT  
 Description: Called when an entry in the CDT table is obtained or released.

Calling Module: CACHESEG  
 Calling Procedures: Get'CDT'Entry, CDT'Free'Entry,  
 CDT'Get'MD'Entry, CDT'Rel'MD'Entry

Parameter Description

P1 = CDT entry number  
 P2 = Type of call  
 0 = Free entry  
 1 = Get entry  
 2 = Get Mapped Domain entry  
 3 = Release Mapped Domain entry  
 P3 = If P2=3 then Ldev Entry number  
 P4,P5,P6 Not used.

G.01.00  
 20- 12

Event 16 (X20)

Event Name: QUE\_LDR  
 Description: Called when an LDR is queued onto the CDT  
 Calling Module: CRCHSEEG  
 Calling Procedure: CDT'Queue'LDR

Parameter Description

P1 = Mapped Domain CDT entry number  
 P2 = LDR entry index to be queued  
 P3 = Queue type  
     X12 - CDT impeded queue  
     X13 - CDT active queue  
 P4,P5,P6 Not used.

Event 17 (X21)

Event Name: DQUE\_LDR  
 Description: Called when an LDR is removed from the CDT queue.  
 Calling Module: CRCHSEEG  
 Calling Procedure: CDT'Dequeue'LDR

Parameter Description

P1 = Mapped Domain CDT entry number  
 P2 = LDR entry index being removed from the queue  
 P3 = Queue type  
     X12 - CDT impeded queue  
     X13 - CDT active queue  
 P4,P5,P6 Not used.

Event 18 (X22)

Event Name: FIND\_DE  
 Description: Called when need to find an assigned CDT  
                   Device entry.  
 Calling Module: CRCHSEEG  
 Calling Procedure: CDT'Find'DE

Parameter Description

P1 = Ldev number of the CDT Device entry to be found.  
 P2 = CDT Device entry  
 P3,P4,P5,P6 Not used.

G.01.00  
 20- 13

MMSTAT Event Group 2Event -20 (-X24)

EVENT NAME: ALCSBCLK  
 DESCRIPTION: REQUEST TO RESERVE A BLOCK OF ENTRIES IN THE CSTX  
 CALLING MODULE: KERNELD  
 CALLING PROCEDURE: ALCSBLOCK

PARAMETER DESCRIPTION

P1=EIX CST BLOCK INDEX ASSIGNED  
 P2=CSTX DST RELATIVE INDEX OF WORD 0  
           OF THE FIRST RESERVED CSTX ENTRY  
 P3=M NUMBER OF CSTX ENTRIES RESERVED  
 P4,P5,P6 - Unused.

Event -21 (X25)

EVENT NAME: DEALCSBCLK  
 DESCRIPTION: INDICATES THAT A CST EXTENSION BLOCK HAS BEEN  
                   DEALLOCATED

CALLING MODULE: KERNELD  
 CALLING PROCEDURE: DEALCSBLOCK

PARAMETERS	PARAMETER DESCRIPTION
P1=EIX	CST BLOCK INDEX ASSIGNED TO THE BLOCK OF CST ENTRIES
P2=CSTX	DST RELATIVE INDEX OF WORD 0 OF THE FIRST CST ENTRY TO BE RELEASED
P3=MCNT	=(NALLOCATED CSTX ENTRIES- NENTRIES BEING RELEASED)*4
P4,P5,P6	- Unused.

G.01.00  
 20- 14

Event -23 (-X27)

EVENT NAME: RELRESOURCES  
 DESCRIPTION: RESOURCES (VOS,MAIN MEMORY, ST ENTRY) RESERVED FOR THE  
                   FOR THE SEGMENT HAVE BEEN RELEASED

CALLING MODULE: KERNELD

CALLING PROCEDURE: RELDATASEG

PARAMETERS      PARAMETER DESCRIPTION

P1=NEW OB OST NUMBER  
 P2=DELTA P AT EXCHANGED CALL  
 P3=STATUS AT EXCHANGED CALL  
 P4,P5,P6 - Unused.

MMSTAT Event Group 3

Event 84 (X124)

Event Name: INITIATE  
Description: Called when starting/completing logical disc request.  
Calling Module: CACHESEG  
Calling Procedure: CDT'Initiator, CDT'Completor

Parameter Description

P1 = CDT Mapped Domain entry number  
P2 = LDR entry index  
P3 = type  
0 = Initiator  
1 = Completor  
P4,P5,P6 Not used.

Event 86 (X126)

Event Name: CDT ATT  
Description: Called from CDT'ATTACHIO.  
Calling Module: CACHESEG  
Calling Procedure: CDT'Attachio

Parameter Description

P1 = Ldev  
P2 = Function  
P3 = Flags  
P4,P5 = Parm1, Parm2  
P6 = Count

Event 87 (X127)

Event Name: MAP DDM  
Description: Called when need to "map" a disc domain.  
Calling Module: CACHESEG  
Calling Procedure: CDT'MAP'CACHE'DDMRAIN

Parameter Description

P1 = New CDT entry number  
P2 = Returned CDT entry  
P3,P4,P5,P6 Not used.

G.01.00  
20- 33

Event 88 (X130)

Event Name: UH MAP RG  
Description: Called when disc domain no longer mapped. (i.e. both the logical and physical I/D is complete).  
Calling Module: CACHESEG  
Calling Procedure: CDT'MAP'CACHE'REGIDN

Parameter Description

P1 = CDT Ldev entry number  
P2 = Region CDT entry number  
P3,P4,P5,P6 Not used.

Event 89 (X131)

Event Name: LINK REG  
Description: Called when a disc domain gets linked into the linked list of domains for an ldev.  
Calling Module: CACHESEG  
Calling Procedure: LINK'CACHE'REGION, UNLINK'CACHE'REGION

Parameter Description

P1 = Type  
0 = Link  
1 = Unlink  
P2,P3 = Address of region base  
P4 = CDT entry number found in the header  
P5 = # of pages  
P6 Not used.

G.01.00  
20- 34

124		174
125		175
126		176
127		177

The ITEM READ/WRITE TABLE starts in user label #3. There are eight words for each ITEM READ/WRITE bit map. For databases with more than 16 items, the read/writes table continues in the next user labels. The specific format of this table is explained after the SET READ/WRITE TABLE since it is defined the same way. The number of user labels occupied by the ITEM READ/WRITE TABLE depends on the number of data items defined in the schema and can be obtained by rounding upwards (ceiling) the result of:

$$\text{Num-of-labels} = \lceil (\text{Num-of-items} * 8) / 128 \rceil$$

Since there can only be a maximum of 255 data items in the schema, the maximum size for this table in user labels would be:

$$\text{Max-size} = \lceil (255 * 8) / 128 \rceil = 15.93 \Rightarrow 16 \text{ labels.}$$

G.01.00  
21- 6

124		174
125		175
126		176
127		177

The SET READ/WRITE TABLE starts on a user label boundary after the ITEM READ/WRITE TABLE.

There are eight words for each SET READ/WRITE bit map. For databases with more than 16 data sets, the read/write table continues in the next user labels. The specific format of this table is shown in the next page.

The number of user labels occupied by the SET READ/WRITE TABLE depends on the number of data sets defined in the schema, and is obtained by rounding upwards (ceiling) the result of:

$$\text{Num-of-labels} = \lceil (\text{Num-of-sets} * 8) / 128 \rceil$$

Since there can only be a maximum of 99 data sets defined in the schema, the maximum size for this table in user labels is:

$$\text{Max-size} = \lceil (99 * 8) / 128 \rceil = 6.18 \Rightarrow 7 \text{ labels}$$

G.01.00  
21- 7

Item/Set Read/Write Table Format

There are eight words per item/set read/writes table definition and up to 16 items/sets per record (user label). Within each 8 words, the first 4 words are the flags for the user classes which have read access to the item/set. The second 4 words are the flags for the user classes which have writes access to the item/set. The detail format for an eight word field is shown below.

A. Four words for read access:

0 15 16 31 32 47 48 63  
|\_word\_1|\_word\_2|\_word\_3|\_word\_4|

4 words represent 64 bits. Bit n represents read access for user class n to the item/set. If bit n is set to 1 then user class n has read access to the item/set.

For example, if the word settings are:

word 1 word 2 word 3 word 4  
X000016 X020000 X000410 X001300

This means that user classes 12, 13, 14, 18, 39, 44, 54, 56 and 57 have read access to the item/set.

If no read/writes security is defined at all for the item/set, then all of the read security bits are set to 1.

B. Four words for writes access:

0 15 16 31 32 47 48 63  
|\_word\_1|\_word\_2|\_word\_3|\_word\_4|

Write access flags have the same format as the read access flags. Bit n represents write access for user class n to the item/set. If bit n is set to 1, then user class n has write access to the item/set. For example, if the word settings are:

word 1 word 2 word 3 word 4  
X000010 X020000 X000000 X001100

This means that the user classes 12, 18, 54 and 57 have writes access to the item/set.

If no read/writes security is defined at all for the item/set, then all of the write security bits are set to 0.

## ADD'DBSTATUS

(0:8) - IMAGE version ('B' in ASCII)  
(8:8) - Binary 1 (filler)

ROOT'DBNAME - DATABASE name left justified (last 2 chars are blank).

NOWOPEN - Number of data sets opened. This field is not used in IMAGE B.

MAXOPEN - Maximum number of data sets that can be opened. This field is not used in IMAGE B.

## NOTE:

ROOT'ITEMPTR and ROOT'DSETPTR is a word offset from record 0 (beginning of the file, not including the space taken by the user labels) and can span several records. These pointers point to the 0th entry of the table and since the 0th entry in the item table or the set table does not really exist, they actually point to 11 words before the beginning of the table. To get to the first entry in the table, this pointer should be incremented by the length of the entry (which is currently 11 words).

G.01.00  
21- 9

## Root File Record 1

bits/	0:1:2:3:4:5:6:7:8:9:10:11:12:13:14:15	X

21		subitem-count subitem-length
22		
23		
24		
25		
26		

The ITEM TABLE starts in record #1.

Each entry is 11 words long and the length of the table depends on the number of data items defined in the schema. The relative position of an item definition depends on its relative position in the schema.

Item-name: is a data item name, left-justified and with trailing blanks

Item-number-of-synonym: is the number of the item whose name has the same hashed result as this one (this is utilized for quick item name searches).

Item-type: is one of the following: I, J, K, R, X, U, Z, or P

item-type  
VALUES, 20J2;  
subitem-length  
subitem-count

The maximum size for this table is  $11 \times 255 = 2805$  words.

## NOTES:

The reserved-1 and reserved-2 fields are the 'old' level numbers for read and write security. Now, the values are always zero.

G.01.00

Set table follows the Item table.

Each entry is 11 words long. The length of the table depends on the number of data sets defined in the schema. The relative position of a set definition depends on its relative position in the schema.

Set-name: is a data set name, left-justified and with trailing blanks.

Set-number-of-synonym: is the number of a data set whose name has the same hashed result as this one (this is utilized for quick set name searches).

Data-set-type is one of the following: A, N or D.

DSCB-pointer: is a pointer to the Data Set Control Block. This pointer is word offset from record #0. The DSCB is described ahead.

The maximum size for this table is  $11 \times 99 = 1089$  words.

NOTES: The reserved-1 and reserved-2 fields are the 'old' level numbers for the read and write access respectively. Since this concept no longer applies, the values are set to zero.

G.01.00  
21- 11

## Data Set Control Blocks (DSCB)- General Layout

DATA SET GLOBAL AREA (set 1) (capacity, lengths, counts, etc.) 30 wds.	
RECORD DEFINITION TABLE (set 1) a. ITEM NUMBERS b. ITEM DISPLACEMENT fieldcount*2+2	DSCB set1
PATH TABLE (set 1) (search item, sort item, etc.) pathcount*2	
DATA SET GLOBAL AREA (set 2) (capacity, lengths, counts, etc.) 30 wds.	
RECORD DEFINITION TABLE (set 2) a. ITEM NUMBERS b. ITEM DISPLACEMENT fieldcount*2+2	DSCB set2
PATH TABLE (set 2) (search item, sort item, etc.) pathcount*2	
DATA SET GLOBAL AREA (last set) (capacity, lengths, counts, etc.) 30 wds.	
RECORD DEFINITION TABLE (last set) a. ITEM NUMBERS b. ITEM DISPLACEMENT fieldcount*2+2	DSCB last set
PATH TABLE (last set) (search item, sort item, etc.) pathcount*2	

The DSCBs follow the SET TABLE in the Root File. There is one DSCB for each data set defined. The function of the DSCB is to define each data set within the data base.

G.01.00  
21- 12

Data Set Control Block (Global Area)

bit/	0: 1: 2: 3: 4: 5: 6: 7: 8: 9: 10: 11: 12: 13: 14: 15	Z
word 0	DSCAP (data set capacity)	0
1		1
2	DSBLOCKLGH (block length)	2
3	DSMEDIRLGH (media record length)	3
4	DSENTRYLGH (entry length)	4
5	DSBLOCKFAC (DSFIELDCT)	5
6	DSPTHMCT (X) DSPRINKEY	6
7	DSPTHPTR (offset to path table)	7
8	logical end of file	10
9		11
10	max num of records in set	12
11		13
12	18 words of binary zeros	14
13		15
14		16
15		17
16		18
17		19
18		20
19		21
20		22
21		23
22		24
23		25
24		26
25		27
26		28
27		29
28		30
29		35

- DSCAP - data set capacity as reported by the SCHEMA processor.
- DSBLOCKLGH - data set block length including the bit map overhead.
- DSMEDIRLGH - data set media record length (remember that this length includes the pointer overhead).
- DSENTRYLGH - data set entry length.
- DSBLOCKFAC - data set blocking factor.
- DSFIELDCT - data set field count. This is the number of fields specified for the data set.
- DSPTHMCT - data set path count. This is the number of paths that are specified for the data set.
- X-DSKEYTYPE - data set key type. If DSKEYTYPE = TRUE then the key is hashed.
- DSPRINKEY - data set primary path or key.  
For master data sets, this is the field number of the search item.  
For detail data sets, this is the field number of the primary path.
- DSPTHPTR - data set path table pointer. Word offset to the data set path table which contains an entry for each path defined. It points to path 0th entry in the table, so to get to the first entry the pointer should be incremented by the length of the entry (which is currently 2 words).

G.01.00  
21- 13

Data Set Control Block (Item Numbers)

word	0: 1: 2: 3: 4: 5: 6: 7: 8: 9: 10: 11: 12: 13: 14: 15
word 0	item_num_of_1st_field item_num_of_2nd_field
1	item_num_of_3rd_field etc.
2	etc. binary_0
3	binary_0

The Item Numbers Table follows the Global Area of the DSCB. The size of this table (in words) is equal to the number of items in the given data set plus 1. The first n bytes are used to carry the item numbers of the fields within the data set. The remaining n+2 bytes are set to binary zeros.

Data Set Control Block (Record Definition Item Displacement)

word	0: 1: 2: 3: 4: 5: 6: 7: 8: 9: 10: 11: 12: 13: 14: 15
word 0	word_offset_to_first_field
1	word_offset_to_second_field
2	word_offset_to_third_field
3	
4	
5	
6	
7	
8	
9	
10	word_offset_to_last_field
11	length_of_entry

This table immediately follows the Item Numbers Table.

The word offset points to the starting location of the field within the media record. Remember that the media record includes the pointer overhead so this offset varies for master and detail data sets: if a master data set has only one path, the word offset for the first field is 10, since there are 10 words of overhead--5 words for the synonym chain pointers and 5 words for the data set chain head that it would be pointing to. On a detail data set with one path, the overhead is only 4 words.

The 'length-of-entry' field is the same as the media record length.

G.01.00  
21- 14

Data Set Control Block (Path Table)

word	0: 1: 2: 3: 4: 5: 6: 7: 8: 9: 10: 11: 12: 13: 14: 15
word 0	1st path definition
1	
2	2nd path definition
3	
4	
5	
6	
7	
8	
9	
10	
11	
12	
13	
14	
15	last path definition

There are 2 words (4 bytes) for each path definition. The PATH TABLE for master data sets has a different layout from the PATH TABLE for detail data sets.

Master sets:

- Byte Description
- 1 - item number of the search item in the related detail set.
  - 2 - item number of the sort item in the related detail set.
  - 3 - set number of the related detail data set
  - 4 - path number of the corresponding path in the related detail data set.

Detail sets:

- Byte Description
- 1 - field number of the search item.
  - 2 - field number of the sort item.
  - 3 - set number of the related master data set
  - 4 - path number of the corresponding path in the related master data set.

General Data Set Layout

Word	0-1
USER_LABEL_0	master=capacity detail=highwater mark
Word	2-3
number of unused records	
Word	4-5
master= not used detail= delete chain head	

G.01.00  
21- 15

Data Set User Label 0

Word 0-1: Record name of the highest readable record. For Masters, this is the highest record in the set (i.e. Capacity). For Details, this is the greatest number of records that have been written to the set thus far. For example, if there is room in the Detail data set for 100 records and 75 were written last week when the data set was loaded with DBLDAD, and yesterday 15 records were deleted from the data set, the "High Water Mark" is equal to a value of '75'.

Word 2-3: Number of unused records in the data set. This field is incremented when a record is deleted and decremented when a record is added. To determine the current number of entries used in the set subtract Word 1-2 (unused count) from Word 0-1 (capacity).

Word 4-5: The delete chain head for Details. This points to the record most recently deleted or contains a value of zero if no records have been deleted. This field is not used in Master data sets.

Data Set Records

The data in the data set records is arranged according to the media records. These are formatted by the Schema Processor (DSCHENR).

G.01.00  
21- 16

## CHAPTER 22 DISC FREE SPACE MAP

## Disc Resident Data Structures

There are two disc resident free space data structures, the bit map and the descriptor table, for each disc volume that has a free space map, i.e. system discs and private volumes. The addresses of these data structures are kept in the disc label. The symbols that define the descriptor table and bit map are in the include file INCLDFS2.

## Bit Map

The bit map is divided up into pages, which is the physical block of the map that is read or written. At the moment, a page is defined to be one sector (128 words) long, this may be changed by changing a compile time constant. The last word of the page is a checksum for that page, all other words are data. There is a one to one correspondence between bits in the map and sectors of the disc. A one bit represents a free sector and a zero bit represents an allocated sector. The bit map is a contiguous set of pages, enough to represent the entire disc, excluding spare tracks and spare sectors.

## Descriptor Table (DT)

The descriptor table is an array of three word entries, one entry for each page of the bit map. Each entry looks like this:

```

=====
word 0 = largest space =
=====
word 1 = starting space =
=====
word 2 = ending space =
=====

```

G.01.00  
22- 1

Thus the descriptor table looks like this.

```

=====
=          = entry for page 0
=====
=          = entry for page 1
=====
=          = entry for page 2
=====
=          = entry for page 3
=====
.
.
.
=====
=          = entry for last page
=====

```

Each entry describes the free space on the corresponding page of the bit map. The largest space word is the size of the largest contiguous block of free space on the page, which is not at the very beginning or very end of the page. That is, the first bit physically representing the space is not the first bit of data on the page or the last bit representing the space is not the last bit of data on the page. Starting space is the number sectors of contiguous space represented by the set of bits whose first bit is the first bit of data on the page. Ending space is the number of sectors of contiguous space represented by the set of bits whose last bit is the last bit of data on the page. The starting space and ending space fields allow looking across page boundaries, thus preventing fragmentation on page boundaries. Thus, if all sectors represented on a page are free, then starting and ending space will be the same and have the total number of free sectors represented on the page. Largest space will be zero, as there is no block of space that is not at the beginning or end of the page. A value of -1 for all the fields in an entry indicates the corresponding page is bad, either from a checksum or I/O error.

## Virtual Memory Resident Data Structures

For each system disc or physically mounted private volume there is a data segment which has information about the disc free space map, the current copy of the descriptor table, some work space for the procedures while in split stack mode and buffers for pages of the bitmap. The DST number of the data segment for a given disc is found in the LDTX entry for that disc.

## Disc Free Space Data Segment

For each system disc or physically mounted private volume in the up and running system there is a DST which contains information about the disc free space map for that disc, some work area, a copy of the descriptor table and buffers for the pages of the bit map.

G.01.00  
22- 2

All symbols that define these data segments are in the include file INCLDFS1, and they are prefixed with "ds". The structure of the data segment is as follows:

```

=====
0 (X0) = ds'ldv =
=====
1 (X1) = ds'dst =
=====
2 (X2) = ds'disc'size =
=====
3 (X3) = ds'last'page'of'nap =
=====
4 (X4) = ds'last'buffer'index =
=====
5 (X5) = ds'nap'address =
=====
6 (X6) = ds'lock =
=====
7 (X7) = ds'lock'count =

27 (X33) = ds'number'of'sectors =
=====
28 (X34) = ds'bit'count =
=====
29 (X35) = ds'entry'type =
=====
30 (X36) = ds'buffer'index =
=====
31 (X37) = ds'disc'address =
=====
32 (X40) = ds'error'status =
=====
33 (X41) =
=====
34 (X42) =
=====

```

The rest of the data segment contains tables whose size and location is dependent on the size of the disc and or the number of buffers in the data segment. They are shown below just to demonstrate their relation to one another, for their actual location, the pointers should be examined. The symbol "ds'array'area" defines the start of the area. The first table is the descriptor table, it is in the same format as the disc copy, but a dummy entry of all zeros is added before and after the table, these are needed by procedures "FindPage" and "BuildDescriptorEntry". The pointer to this table is "ds'descriptor'table", it points to the entry for page zero, not the dummy entry.

G.01.00  
22- 4

**Disk Free Space**

```

=====
#          buffer 0 entry
=====
#          buffer 1 entry
=====
#          :
#          :
#          :
=====
#          least buffer entry
=====

```

The remainder of the data segment contains the buffers, each buffer is the size of one page of the bit map, which is currently one sector (128 words). The beginning of the buffer area is pointed to by "de'buffer'area" and the number of buffers is the value in "de'laet'buffer'index" plus one.

G.01.00  
22- 7

## CHAPTER 23 MPE DISC CACHING

## Disc Caching Overview

Disc Caching is an optional feature of MPE that utilizes excess main memory and excess CPU horsepower to keep portions of frequently referenced disc "domains" in memory. (A disc "domain" is a copy of a portion of disc residing in main memory. These disc domains are considered "cached" when they are in memory and are considered "mapped" when there is I/O pending against them.) Disc Caching manages the bi-directional transfer of these disc domains between main memory and disc storage. No main memory is permanently dedicated to cached disc domains. Cached disc domains share main memory with all other types of MPE segments and are not treated differently by the memory manager. By keeping cached disc domains in memory, a significant portion of the references to disc storage can be resolved without actually having to physically access the disc. Disc Caching policies are integrated into the MPE Kernel, File System, and I/O System which allows the system performance to be tuned based on the current workload and resource availability.

Disc Caching uses the MPE kernel resource management mechanisms and strategies. These mechanisms are extended to handle cached disc domains in the same manner as segments. Thus, cached disc domains can be of variable size, fetched in parallel with other segments or cached domains, garbage collected, and replaced in the same manner as stacks, data and code segments. The relative use of main memory between stacks, data and code segments, and cached disc domains is dynamic. This partitioning is based on the workload's current requirements and current memory availability.

Disc Caching can be enabled/disabled on a disc by disc basis. When caching is enabled for the first disc, the code segment containing the Disc Caching code will be locked into memory. Also at this time the Cache Directory Table (CDT) will be built and locked into memory. When caching is disabled for the last disc, the code segment will be unlocked from memory and the CDT will be released. Thus if caching is not enabled no memory will be wasted.

The CDT is used to keep track of the following information:

- 1) The disc ldevs currently enabled for caching. There will be a Device Entry in the table for each cached disc.
- 2) A linked list of cached domains for each disc with caching enabled. The head and tail of this linked list will be contained in the Device Entry. (I.e. there is a separate linked list of cached domains for each cached disc ldev.)
- 3) The cached domains that currently have user I/O pending (i.e. FRERDS/FWRITES) or have memory management I/O pending (i.e. fetching the disc domain into memory, or posting the disc domain back out to disc). There will be a Mapped Domain Entry in the table for each disc domain has that I/O pending and is thus "mapped".

G.01.00  
23- 1

- A linked list of all user I/O pending against the mapped disc domains. There will be a Logical Disc Request (LDR) queued to the Mapped Domain entries that will describe the user I/O to take place. This is analogous to a Disc Request queued to a specific DIT waiting for service.

When a request is made to access disc information, Disc Caching must first determine if the requested disc domain is present in memory. Disc Caching will first determine if the requested area of disc is already mapped into memory by scanning through the Mapped Domain entries of the CDT. If the requested transfer can be satisfied with a currently mapped disc domain, then the I/O request will be queued (FIFO) behind the other I/Os pending against that mapped domain. If the requested area is not already mapped, then a search is made through the linked list of cached disc domains for the specified disc ldev. (The region header contains the disc address and size that a disc domain represents.) If the requested domain is found in this list (i.e. present in memory), then this region will be mapped. R domain is then considered mapped when there is an entry for it in the Mapped Domain portion of the CDT. Mapping the domain allows Disc Caching to manage the I/O pending and/or currently active for a particular disc domain. Once the disc domain is mapped and present, the data can be moved between the process' data area and the mapped disc domain. The process can then continue executing without interruption or a process switch. The user/subsystem process for which the move is done will be charged with the CPU overhead.

When a request is made to read data that is not currently cached in memory (i.e. a read "miss"), the fetch strategy uses the File System's knowledge of the type of access (sequential or random), the extent size of the file, along with the current memory load to select the optimal size of the disc domain to be fetched and mapped into memory. The fetch of the disc domain is then initiated on the user's stack without a process switch. After the fetch is initiated, it completes in an unblocked manner so that this process (if no-wait I/O) or another process can proceed in parallel with the cache fetch.

In general, when writing, a process will not wait for completion of the physical I/O. Instead, the process will be awakened as soon as the transfer has completed between the process's data area and the mapped disc domain (i.e. no-wait-for-post). The physical I/O will then be posted at background priority while the process continues. (Users can specify wait-for-post on a file by file basis in place of the default no-wait-for-post with the FSETMODE intrinsic. This can be done on a global basis via :CACHEDCONTROL.) If the access request is a write and there is a current write pending against the specified mapped disc domain, the process request is queued until the pending write is posted to disc. If the disc domain to be written is not currently cached in memory, a free piece of memory will be obtained to map the corresponding disc image and then the "write" takes place from the process' data area to the mapped disc domain. This prevents data from having to be read before being written. After that, a post to disc is initiated (on any write only the portion of a mapped disc domain that is modified will be posted to disc). After the move to the mapped disc domain is complete and the post to disc is initiated, the process performing the "write" is allowed to continue to run without having to wait for the post to complete. Writes that must be posted to disc in a certain order use the Global Serial Write Queue. These

G.01.00  
23- 2

## Disc Caching

ordered writes include things like updating disc free space maps for a new file extent before updating the file extent map in the file label.

There are two disc request entries used for disc caching requests. The first entry is a Logical Disc Request (LDR) entry and is used to manage the data moves to/from the user's data area and the disc domain (i.e. the logical I/O). The second entry is a regular Disc Request (DRQ) entry and is used to perform the physical I/O necessary to map a disc domain (for a read "miss") or to perform the physical post (on write requests). The disc domain will remain mapped until both the logical and physical I/O completes. If a request is not completely described by one disc domain already in memory or a Mapped Domain CDT entry (i.e. the requested disc area falls into more than one disc domain) then the overlapping disc domain(s) will be flushed to disc and the new complete disc domain will be fetched (if read) and mapped - no partial mappings are allowed.

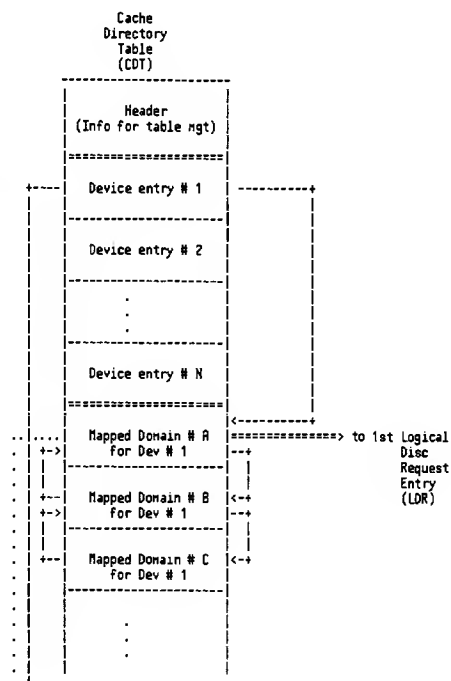

The DST number of the Cache Directory Table (CDT) is at X1273 and the bank and offset are kept in X1274-X1275. The Caching Sir (2) is used when starting and stopping caching (via :STARTCACHE/:STOPCACHE) and by the LORDER when loading a program file (this sir is only used when updating the STT at load time).

When caching is enabled for a disc, a bit in the flags word of the DIT is set. Also, the Global Serial Write queue can be found by examining the header entry of the Disc Request Table. See Chapter 13 for a more detailed explanation of both the DIT and the Disc Request Table header. See Chapter 2 for a description of the Memory Region Header for a disc domain (cached region).

## Disc Caching

## Disc Caching Tables Overview

G.01.00  
23- 4

## Memory Regions

G.01.00  
23- 5

## Cache Directory Table

The Cache Directory Table (CDT) is the bookkeeping structure for managing cached disc domains. This table is divided into 3 parts:

CDT Header Entry

This entry contains all information necessary to manage the entire table and also contains global caching related information.

CDT Device Entry

There will be one of these entries for every disc ldev that currently has caching enabled. These entries keep track of all cached disc domains in memory for this device. In addition, these entries contain statistics regarding the number of I/Os performed to the ldev.

CDT Mapped Domain Entry

These entries describe disc domains that are currently "mapped" into memory. This means that there is logical I/O (cache move) and/or physical I/O (fetch or post) pending. These entries keep track of the state of the cached disc domain (INI, RDC, etc.) just as the DST Table keeps track of data segments.

The following low core calls contain the address of the CDT:

X1273 contains the DST Number of the CDT  
X1274 contains the Bank Number of the CDT  
X1275 contains the Offset within the bank of the CDT

G.01.00  
23- 6Header Entry

0	# Entries	CDT'ENTRIES
1	Entry Size (X30)	CDT'SIZE
2	# Free Entries	CDT'FREE'COUNT
3	1st free Entry (table offset)	CDT'FREE'HEAD
4	Last free Entry (table offset)	CDT'FREE'TAIL
5	Max # Entries Used	CDT'MAX'USED
6	# Ldevs cached	CDT'NUM'LDEVS
7	1st Cache device entry (entry number)	CDT'DISC'HEAD
X10	# Words this DST	CDT'DST'WORDS
X11	TRUE if stopcache pending	CDT'STOP'PND
X12	# Sectors sequential fetch	CDT'SEQ'MINFTCH
X13	# Sectors random fetch	CDT'RND'MINFTCH
X14	TRUE if wait for physical post	CDT'FORCE'POST
X15	Head of impeded queue (PIN)	CDT'STOP'QUEUE
X16		
X27		

G.01.00  
23- 7CDT'ENTRIES

The total number of CDT entries configured in this table (i.e. includes all three types of entries). The number of entries in the table will be:

- 1 entry for the header
- + 1 entry for each disc ldev configured.  
(CDT Device entries)
- + 1 entry for each DRQ configured.  
(CDT Mapped Domain entries)

This scheme insures that this table can never overflow (since an entry in the DRD table is always obtained before an entry in this table).

CDT'SIZE

Size of each entry in the table.

CDT'FREE'COUNT

Total number of entries currently unassigned.

CDT'FREE'HEAD

Table relative offset (i.e. Entry number \* entry size) of the first available entry.

CDT'FREE'TAIL

Table relative offset of the last available entry.

CDT'MAX'USED

The maximum number of entries in use at one time.

CDT'NUM'LDEVS

The number of ldevs currently cached.

CDT'DISC'HEAD

The entry number of the first Device Entry.

CDT'DST'WORDS

The total number of words in this data segment.

CDT'STOP'PND

This value will be TRUE if there is a pending :STOPCACHE.

CDT'SEQ'MINFTCH

If there is a prefetch for a sequential read ("miss"), the size of the prefetch is delimited by the extent size of the file. Within this limitation, the prefetch is equal to the greater of two sizes:

- 1) Requested size.
- 2) The largest integer multiple of the request size that is smaller than the value found in this cell.

The default value is 96 sectors. (This value may be changed via :CACHECDTRDL).

CDT'RND'MINFTCH

This is the same as CDT'SEQ'MINFTCH except that it's for random access. The default value is 16 sectors. (This value may be changed via :CACHECDTRDL).

G.01.00  
23- 8

## CDT'FORCE'PDST

When this value is TRUE, all writes will "block" until the physical update on disc completes. The system default is FALSE. (Can be altered via :CACNECONTROL).

## CDT'STOP'QUEUE

If CDT'STOP'PENDING is TRUE this will be the PIN number of the head pin of the processes impeded until the :STOPCRONE completes.

G.01.00  
23- 9

## Device Entry

0	Next ldev entry (entry number)	CDT'DE'NEXT'LDEV
1	Prev ldev entry (entry number)	CDT'DE'PREV'LDEV
2	Ldev for this disc	CDT'DE'LDEV
3	# Pages in device's domain	CDT'DE'MAPD'PAGES
4	# Disc domains currently mapped	CDT'DE'MAPD'CNT
5	Head of mapped domain (entry number)	CDT'DE'MAPD'NEHD
6	Tail of mapped domain (entry number)	CDT'DE'MAPD'TRIL
7	# Disc domain regions for this device	CDT'DE'REG'DNS
X10	Memory address of head cached disc domain	CDT'DE'REG'ND
X12	Memory address of tail cached disc domain	CDT'DE'REG'TL
X14	# Read hits	CDT'DE'RNIT
X16	# Write hits	CDT'DE'WNIT
X20	# Read misses	CDT'DE'RMISS
X22	# Write misses	CDT'DE'WNISS
X24	# Stops	CDT'DE'STOP
X26	Memory address of last referenced domain	CDT'DE'SCRNPT

G.01.00  
23- 10

## CDT'DE'NEXT'LDEV

The entry number of the next Device Entry.

## CDT'DE'PREV'LDEV

The entry number of the previous Device Entry.

## CDT'DE'LDEV

The Ldev number for this cached device.

## CDT'DE'MAPD'PAGES

Total number of main memory pages allocated to disc domains for this cached device. This includes mapped and unmapped regions. (1 main memory page = 128 words).

## CDT'DE'MAPD'CNT

The total number of Mapped Domain entries associated with this Device Entry.

## CDT'DE'MAPD'NEHD

The entry number of the first Mapped Domain entry for this device.

## CDT'DE'MAPD'TRIL

The entry number of the last Mapped Domain entry for this device.

## CDT'DE'REG'DNS

The total number of disc domain regions for this ldev (includes mapped and unmapped regions).

## CDT'DE'REG'ND

Memory address to the head region of the disc domain linked list. Disc domain regions are linked in order based on the disc address they represent (i.e. small disc address at head, large disc address at tail). This address will not point to the region base (RB), but to the next domain (ND) field of the region header. (This is to facilitate the use of the LLSH instruction).

## CDT'DE'REG'TL

Memory address of the tail region of the disc domain linked list. This address will be of the previous domain (PD) field of the region header.

## CDT'DE'RNIT

Total number of times that a read was requested and the requested disc domain was present in memory - i.e. a read "hit". This means that the read completed without performing any I/O (to fetch the domain). Thus this is actually the number of read I/Os eliminated. This value will reset to zero on overflow.

## CDT'DE'WNIT

Total number of times that a write was requested and the requested disc domain was present in memory - i.e. a write "hit". If there was no other write pending to the "hit" domain, then the process would continue as soon as the cache move completes - thus eliminating a block for I/O. Otherwise, the process would block waiting for the first write to complete. This value will reset to zero on overflow.

G.01.00  
23- 11

## CDT'DE'RMISS

Total number of times that a read was requested and the requested disc domain was not in memory - i.e. a read "miss". This means that the requested disc domain had to be fetched into memory before the read could complete - thus potentially blocking the process. This value will reset to zero on overflow.

## CDT'DE'WNISS

Total number of times that a write was requested and the requested disc domain was not in memory - i.e. a write "miss". This does not mean that the process would block until the disc domain is fetched as is the case for reads. Rather, a free memory region would be obtained to be the destination of the cache move. This disc domain would then be posted in the background (unless overridden via :CACNECONTROL or FSETHMODE) allowing the process to continue without blocking. This value will reset to zero on overflow.

## CDT'DE'STOP

Total number of times that a process had to block on a cache transfer. Will reset to zero on overflow.

## CDT'DE'SCRNPT

The memory address of the last region looked at on a search. This address will be of the next domain (ND) field of the region header. This value will be used along with CDT'DE'REG'ND to determine where to start the next search for a cached disc domain. At times it will be more efficient to start with this address since the disc domain requested may be of a higher disc address than found in this region header, rather than always starting the search with CDT'DE'REG'ND.

G.01.00

X27	.	

G.01.00  
23- 13

CDT\*MD\*PREV

Entry number of the previous mapped domain entry for this device.

CDT\*MD\*NEXT

Entry number of the next mapped domain entry for this device.

CDT\*MD\*SECTOR

The starting disc sector address representing this mapped domain entry.

CDT\*MD\*END\*SECTOR

The ending disc sector address representing this mapped domain entry.

CDT\*MD\*FLAGS

Flags describing the status of this mapped domain entry and the region associated with it:

- (0:1) - **ABSENT**.  
Region is not present in memory.
- (1:1) - **INI**.  
Region is already In-Motion-In. (Set when the fetch for this cached region is initiated).
- (2:1) - **INO**.  
Region is In-Motion-Out. (Set by STARTOBJWRITE when performing the background post of a cached region).
- (3:1) - **MISS**.  
This disc domain was not present and had to be prefetched.
- (4:1) - **LOCK**. Not used.
- (5:1) - **FWIP**.  
Forced Write In Progress. Region was forced out of memory to make room for another object.
- (6:1) - **ROC**.  
Recover Overlay Candidates. Region may be forced out of memory to make room for another object. However, if this region is referenced again it can be recovered.
- (7:1) - **VRGIN**.  
Clean region in the write state. Cleared as soon as a move completes. (I.e. if this bit is on, then a write can complete immediately. Otherwise the write will have to wait until the current write completes the physical post).
- (8:1) - **NOPOST**.  
Set when the CDT is being posted out as a result of a write request that did not want to wait for the physical post to complete. This will be cleared by the cache controller when the physical post completes. (This is used to insure that a cache move for any subsequent write request will not be serviced until the physical post completes.)
- (9:1) - **SEQ**.  
Set if doing sequential I/O. When the request for the last area of this disc domain is complete, this domain will be made a ROC.
- (10:3) - Not used.
- (13:3) - **STRIP**.  
D - AVAIL. CDT is an available entry.

G.01.00  
23- 14

- 1 - READ. Only read LDR(s) are attached.  
2 - WRITE. Write LDR(s) and possibly read LDR(s) are attached.  
3 - FLUSH. CDT is being flushed out.  
4 - LOCK. Unused.

CDT\*MD\*READ\*Cnt

The number of LDRs attached that are for reads (move not complete).

CDT\*MD\*WRITE\*Cnt

The number of LDRs attached that are for writes. NOTE: This count will not be decremented until both the cache move and the physical write complete. However, as soon as the cache move completes, the LDR will be dequeued from the CDT.

CDT\*MD\*LKD\*CDT

Not used.

CDT\*MD\*IMPED\*HD

The first LDR that is impeded. (I.e. the CDT is in a write state already and another write is attached. The second write will be placed in this queue until the first write completes.)

CDT\*MD\*LDR\*HEAD

The first LDR that is on the active list for this CDT.

CDT\*MD\*MEM\*ADR

The memory address (region base) for this mapped disc domain, if present.

CDT\*MD\*DISCREQ

The disc request table index associated with this mapped disc domain. This will be used to fetch this region in, or to post this region after any logical I/Os (writes) have completed. (I.e. this DRD is used for the physical I/O.)

CDT\*MD\*LK\*Cnt

Not used.

CDT\*MD\*LDEV

The ldev number for this mapped domain.

CDT\*MD\*IMPEDED

The PIN for the first process impeded on this mapped disc domain. Processes get impeded here when they do WRITEFORID when their LDR is on the CDT impeded queue and the mapped domain is currently being written out. (This will also happen upon a STOPCRCHE to force all LDRs to complete.) As soon as the physical post of the mapped domain is complete, all processes impeded here will be awakened.

CDT\*MD\*DE

The entry number for the Device entry that this Mapped Domain entry is associated with.

G.01.00  
23- 15

## Logical Disc Request Table

X1017 Pointer to Logical Disc Request Table

NOTE:

This table is really part of the DRD (Chapter 13). Any entry with the logical request bit set in the flags will conform to this format and not the format of the standard DRD.

Logical disc requests entries are used to manage requests between the requesting process and a mapped disc domain. They are the counterpart of disc requests entries used to manage physical I/O requests between a process and a disc. These entries are kept as part of the DRQ Table, but will never be queued to the disc's DIT, instead they will be queued to the mapped disc domain CDT entry. LDR entries may only be placed onto the following queue:

- 1) The CDT active list.
- 2) The CDT impeded LDR list.
- 3) The Disabled Disc Request. (This will only happen if the buffer segment is absent when the logical I/O (cache move) is attempted.)

NOTE:

LDRs are singly linked onto the CDT queues and doubly linked onto the disabled disc request queue.

G.01.00  
23- 16

## LDR' FLAGS

```

Flags.
(0:3) - Not used.
(3:1) - SBUF.
        Set if request is to/from a System Buffer.
(4:1) - IOWAKE.
        Set if system should wake up the process when the logical
        I/O completes.
(5:1) - BLOCKED.
        Set if the process wants to wait for the logical disc
        request to complete.
(6:1) - DONE.
        Set when the logical disc request is complete and the
        process will be awakened (if IOWAKE is set)
(7:1) - DD'POST.
        Set if the caller wants to be waited until the physical
        post to disc completes. Only valid for write requests.
(8:1) - SERIAL'POST.
        Set when the physical post should be through the Global
        Serial Write queue.
(9:1) - CDT'QUEUED.
        This request has been queued - either onto the CDT active
        queue (see CDT Mapped Domain entries) or onto the disabled
        disc request list.
(10:1) - MOVE'DONE.
        The move has been completed, but the process won't be
        awakened until the DONE bit is set.
(11:1) - Not used.
(12:1) - CUR'REQ.
        Set if this request is the current/active request.
(13:1) - DISABLE.
        Set if the request is disabled.
(14:1) - LDR'REQ.
        Set if this is a logical disc request.
(15:1) - LDR'INLDC.
        Set if Mapped Domain CDT entry is in process's locality
        list.

LDR'L'HODR
The High Order Disc Address of the extent limit. (See note with LDR'B'HODR).

LDR'LDEV
The ldev for this request.

LDR'CDT
The CDT number for the Mapped Domain entry associated with this request.

LDR'BUFDST
Data Segment number for the target of the logical I/O request. If bit zero
is set, then this is the process's stack.

LDR'BUFDADR
Offset within the DST (above) for the target address. If the DST is the
process's stack, then this address will be DB relative.

```

G.01.00  
23- 18

## CHAPTER 24 NATIVE LANGUAGE SUPPORT

### NL/3000 Internal Table Structure

NLS FILE CODES  
 LANGDEF.PUB.SYS - 1228  
 CHRDEFXX.PUB.SYS - 1229  
 NLSDEF.PUB.SYS - 1229

### Native Language Support (NLS) Table Overview

G.01.00  
 24- 1

## Native Language Support

### Native Language Table (NLT)

This table is created by INITNLS (called by PROGEN). The DST number is contained in SYSGLob extension X12. The Native Language Table (NLT) contains the description of all the character sets needed to support the installed languages, and additional information needed to support the configured languages (DST numbers of the languages associated DSTs, character sets, etc.).

Every installed language has had an associated Language DST, set up by INITNLS.

G.01.00  
 24- 2

## Native Language Support

### NLT Overhead Table

The NLT overhead table is 8 words long.

0	"N"	"L"
1	"T"	" "
2	LENGTH OF NLT (IN WORDS)	
3	NUMBER INSTALLED LANGUAGES	
4	NUMBER INSTALLED CHAR SETS	
5	SYSTEM LANGUAGE ID NUMBER	
6	SYSTEM LANGUAGE LDST NUMBER	
7	RESERVED	

G.01.00  
 24- 3

## Native Language Support

### NLT Installed Language Table Format

For each of the supported non-NATIVE3000 languages there is a 12-word language entry.

0	LANGUAGE ID NUMBER	<---
1	LANGUAGE CLASS	
2	LANGUAGE LDST NUMBER	
3	CHARACTER SET ID NUMBER	
4		--1st SUPPORTED LANGUAGE ENTRY
11	LANGUAGE NAME (8 WORDS)	<---
0	LANGUAGE ID NUMBER	<---
1	LANGUAGE CLASS	
2	LANGUAGE LDST NUMBER	
3	CHARACTER SET ID NUMBER	
4		--Nth SUPPORTED LANGUAGE ENTRY
11	LANGUAGE NAME (8 WORDS)	<---

G.01.00  
 24- 4

MLT Installed Character Set Table Format

For each character set installed on the system there is an 11 word character set table. It has the following format:

0	CHARACTER SET ID NUMBER
1	CHARACTER SET TYPE
2	POINTER TO CHARACTER ATTRIBUTES TABLE
3	
===	CHARACTER SET NAME (8 WORDS)
10	

G.01.00  
24- 5

MLT Character Attributes Table

The MLT Character Attributes Table is comprised of a table for each configured character set. At this time, only two character sets are configurable: Class Four Languages (KANJI-based) and Nonclass Four Languages.

The type = 1 attributes table is a 256 byte table. Each byte corresponds to a character with that octal value.

Attributes 0	- numeric character
1	- special character (e.g. "!", "?", "." etc.)
2	- alphabetic uppercase character
3	- alphabetic lowercase character
4	- control code
5	- invalid character (unused code)

G.01.00  
24- 6

Language DST

For each language installed on a target system (with the exception of NATIVE-3000) INITNLS will build one language DST with the following structure:

LDST OVERHEAD TABLE
LDST TRANSLATION TABLES (5 subtables)
LDST CUSTOM DATA TABLES
LDST NATIONAL SPECIAL TABLE (an optional table)

G.01.00  
24- 7

LDST Overhead table

The overhead region has the following format:

0	"L"   "O"
1	"S"   "T"
2	LDST SIZE IN WORDS
3	MLT DST NUMBER
4	LDST OFFSET TO CUSTOM DATA TABLES
5	LDST OFFSET TO NATIONAL SPECIAL TABLES
===	RESERVED
7	

The national special table is optional. If it does not exist, the pointer to it is zero.

LDST Translation Tables

For each language a number of translation tables are stored:

LDST UPSHIFT TABLE (128 WORDS)
LDST DOWNSHIFT TABLE (128 WORDS)
LDST ASCII -> EBCDIC CONVERSION TABLE (128 WORDS)
LDST EBCDIC -> ASCII CONVERSION TABLE (128 WORDS)
LDST COLLATING SEQUENCE TABLE (class dependent)

G.01.00  
24- 8

LDST Collating Sequence Table

The LDST Collating Sequence Table is of different formats depending upon the class of the language.

Overview

**Class One Languages:** Some languages, namely American English and Katakana, can be collated by using the numerical representation of the ASCII encoding as the sequence number for any given character. These languages can use the Compare Bytes machine instruction.

**Class Two Languages:** Some languages may be able to use the COBOLII machine instruction, Compare-Translated-Strings. These languages need to have a one-to-one mapping of character encoding to sequence number. Any algorithm for this class of language must take into account the fact that not all HP 3000s have the COBOLII firmware.

**Class Three Languages:** Many languages will not be able to use either of the tactics described above. There are a number of language-dependent algorithms that need to be supported.

**Class Four Languages:** Some languages require 16-bit character string encoding. Collating these languages is not supported. The collating sequence table for this class of language is reserved.

Class One Languages

Since class one languages will use the compare bytes machine instruction (CHPB), the whole collating sequence table for this class is 3 words.

0	3
1	language ID
2	language class

G.01.00  
24- 9

Class Two Languages

This sequence table has a 13-word overhead table and a 128-word sequence table.

0	139	<-Overhead table
1	LANGUAGE ID	
2	LANGUAGE CLASS	
3	11	
4	128	
5	0	
6	0	
7	0	
X10	0	
X11	lowest char. sequence value   highest char. sequence value	
X12	reserved	<-Sequence table
X13	sequence # 0   sequence # 1	
	sequence # 2   sequence # 3	
	sequence # 254   sequence # 255	
X212	sequence # 254   sequence # 255	

Note: Word X11 of the overhead contains in the left byte the character value, which has the lowest sequence number and in the right byte the character value, which has the highest sequence number.

In the 128-word sequence table, the byte value of the character is used as a byte pointer in the collating table.

The byte value of the character is used as a byte pointer collating entries.

G.01.00  
24- 10

X370	2:1 Character Mapping Table	
	1:2 Character Mapping Table	

G.01.00  
24- 11

Class Three Languages (Cont.)

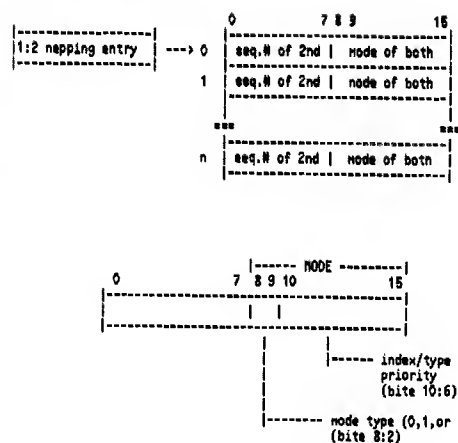

0	7	8	9	15	These characters will be ignored when sorted.
0	0	0	0	0	
OR					all 1:1 mapping characters without case or accent priority
sequence #	0	0	0	0	
OR					1:1 mapping characters with case or accent priority
sequence #	0	0	0	priority	
OR					2:1 mapping characters
sequence #	1	1	index		
OR					1:2 mapping characters
seq. # of 1.	2	2	index		

The byte value of the character is used as an index to the sequence entries.

G.01.00  
24- 12

### 1:2 Character Mapping Table

Entry has same format as one above.

### LDST Custom Data Table Format

This table is 196 words long. The formats and information in this table are language dependant, and may be modified with LANGINST.PUB.SYS.

LDST National Special Table

This table is optional and its existence is signaled by a nonzero pointer in the LDST overhead region. It is used to store data unique to a given language -- e.g. the Emperor data for the Japanese calendar.

Length
national dependent data

Date Formats for Japan and Taiwan

For a given language, there is only one date format possible. The format of the year stored in the date format of the LDST can either be yyyy or yy for the Julian dates or Myy for either the Japanese date (Emperor Era) or the Taiwanese date foundation of republic date).

If the format of the year stored as the date format in the LDST is Myy then either the Japanese emperor dates or the Taiwanese foundation date has to be stored in the national dependent table.

G.01.00  
24- 17

National Dependent Table Formats

X0	length of table(words)
X1	id
X2	number of entries
X3	num of MP supplied entr.
X4 + X5	period entry 1
***	
(2n+2) + (2n+3)	period entry n

The period entries are two word entries of the following format:

0	6 7	15	
year of century	day of the year		word 1 (starting date)
0	7 8	15	
starting year	emperor symbol		word 2

The ID for Japanese and Taiwanese date formats is always set to 1.

G.01.00  
24- 18

Japanese Date Format

There are three entries which do not change. The user can add new entries. These entries have to be stored in ascending order sorted by word 1.

The values of the entries are:

	starting date (MOY)	octal value	starting year	emperor symbol
*	1/ 1/1873	X1	X41	M
	7/30/1912	X14324	X1	T
	12/25/1926	X32547	X1	S

\* since this starting time is in the 19 th century and we are not able to handle dates before 1900 easily, we store X1 as starting time.

For new date entries created by the customer the starting year will always be 1.

G.01.00  
24- 19

Taiwanese Date Format

There are two entries for the Taiwanese national dependent table.

The values of the entries are:

Starting date (MOY)	Octal value	Starting Year	Emperor symbol
1/ 1/1900	X1	X0	X40
1/ 1/1912	X14001	X1	X40

The user does not need to add new entries.

G.01.00  
24- 20

## READER COMMENT SHEET

MPE V Tables Manual for MPE V/E, Version G.01.00

32033-90040

January 1985

We welcome your evaluation of this manual. It is one of several that serve as a reference source for HP 3000 Computer Systems. Your comments and suggestions help us to improve our publications and will be reviewed by appropriate technical personnel. HP may make any use of the submitted suggestions and comments without obligation.

Is this manual technically accurate?      Yes ☐ No ☐      (If no, explain under Comments, below.)

Are the concepts and wording easy to understand?      Yes ☐ No ☐      (If no, explain under Comments, below.)

Is the format of this manual convenient in size, arrangement and readability?      Yes ☐ No ☐      (If no, explain or suggest improvements under Comments, below.)

Comments:

We appreciate your comments and suggestions. This form requires no postage stamp if mailed in the U.S. For locations outside the U.S., your local HP representative will ensure that your comments are forwarded.
